-------------------cut here----------------------

DIRECTION FINDING IN DF SINGLE PORT MODE!

Since we have just about concluded that you need a manual push button for the operator anway (thanks Joe Moel, K0OV), it becomes trivial for us to add the DF serial data to the existing shared GPS/TNC/HSP serial port. The following schematic shows how the serial data from all three devices is switched and how a second pair of contacts is used to alert APRS, when the DF data is connected.

```
                                      DF PUSH           LAPTOP
            ----------                BUTTON            SERIAL
TNC DATA >--|  HSP   |                                   PORT
            |        |--------------------*
GPS DATA >--| SWITCH |                    |
            --*-------                   ----------*----------> RXD
              |
              |                           |
DF DATA  >--------------------------------*

              _
              ^ D1                       ----------*
              |       4.7 k                        |
TNC DSR  >-----------/\/\/\/--*           |      -----
              |               |           |      /////
              |               |           |
TNC DTR  >----*---->|---------*-----------*-------------------> DSR
    RTS           D2
```

The second pole of the DPDT push button not only grounds the DSR input to the PC so that it knows to begin parsing DF data, but also grounds the TNC DTR (RTS) input so that the TNC holds off any packet data until after the DF switch is released. Notice that two diodes, D1 and D2 isolate the TNC DTR (RTS) line so that either the HSP or the DFSP can pull the line to ground without affecting the other. Some TNC's (PACCOMM) use the RTS line instead of the DTR line for holding off TNC data, so check your TNC manual. The TNC DSR line is only used to provide a source of +V. APRS distinguishes between the TNC and GPS data using the normal HSP logic. Remember to provide the DSR or other source of +V for the HSP circuit.

If you are not using the TNC, leave out the diodes, the connection to the TNC's DSR, and the resistor. Connect the GPS to the side of the DF Push Button that would normally go to the HSP board. This should work great.

Good luck and I'm definately going to buy one of those DFjr's when I can muster up the funds!

This is a big subject, and depends very much on the specific
implementation of Java and the OS involved. Most Javas allow access to
local files when a Java program is run as an application, rather than an
applet (as within a browser). In unix you operate on the hardware as a
filename beginning with '/dev'. Other OSes have different methods. It
will take a while for all this to get settled out. In any event, it is
definitely possible to call native code from a Java application, so it
would be easy to write a short C procedure in each OS that opens a comm
port, and sends the data back and forth. This is the method I am planning
to use for javAPRS.

I am. Think about how you want to use javAPRS. To me, the major use is to
allow an APRS map window to pop up on a web page, showing either live or
archived data. Do you really want to run APRS all the time within
Netscape? Didn't think so!

To show live data, you need a server application that can accept connects
via TCP/IP, and send out the data to clients as it comes in. That program
exists, it's called SerialServer, and I wrote it. It only runs on the
Mac, so someone else will have to write one for windows if windows users
are to be able to show their data live.

Sorry Bernard but i have to disagree with the above statement that it will
swamp the darned thing everytime!. I have NEVER run into this problem and i
have been running GPS for several years now. I have both a dual band antenna on
my pickup for 2m/440 hooked to a Yaesu FT-5100. I used to run an external
antenna with my GPS but have now taken it down and am running it just setting
on the dashboard. Either way i never have had that problem. NOT KNOCKING the
Garmin because i think it's a great gps for the price, but you know the old
saying "You only gets what you pay for". My Magellan NAV-5000DX has NNEVER lost
lock while using my FT-5100 which is for the most part TXing in the 50watt
mode, and just below that is my Alinco DR-1200 for the GPS tracker.

Joe I understand...

>From the other side of the coin, I too find "most" of the information
informative but 109 APRSIGs posting a weekend is a bit much.
There are those of us that use EMail for professional reasons and
sorting out the APRS from the business mail get to be a bit much.

Question to the SIG manager, one solution would be an archive that
could be access via the WWW.

Does such a archive exist?

This might solve both problems.

Rendered body type: text/plain

I would be in favour of an os/2 version.

I guess code warrier will not port directly to os/2.

It might be easier to recompile the dos version so it would run in an os/2 window. Under a Dos Box, it does steal alot of system resources.

Just my vote.

cheers...mike

(now, is someone has a os/2 driver for an ATvantage-X/X4P 4 port serial card, it would really make my day.

Thats good progress given the short time you've had. I will
"stay tuned".   OS/2 Java won't be publicly released

for at least 3 months so I can't run it now anyway. I could
download the Java beta now but I really don't don't want to deal
with the bugs ;-)

Mine does too.

I wasn't going to reply to the original posting and add to the mail in you
mail boxes because I thought everyone would agree. Since I was wrong,
here goes.

Unfortunately, I missed the previous discussion Gerry referred to.

This is probably because I have to turn off the SIG when I leave for an extended
trip to avoid problems with my mail box overflowing.

The vast majority of my E-mail is more time-critical and relavent to my
day-to-day life than the letters from this SIG. It would be nice not to have
to sort through the SIG E-mail when I don't have time or inclination.

I don't understand the comments about USENET drivel. I only participate regularly
in one USENET group, rec.aviation.soaring, and I see little difference between
the drivel level. The main difference is that my news reader helps me organize
better (what is drivel to me is probably important to someone else).

Also, having never had to beat back a "Krazy Kevin magazine attack", I don't know
what one/it is.

Just my opinion.

Too bad APRS is not tracking the Olympic Torch. Qualcomm still has it
in Albany, where it was scheduled to be two days ago. I know for a
fact it went down Broadway in New York City last night because my
friends all went out and watched the rolling Coca-Cola/BMW commercial
go by -- oh yeah, and hidden somewhere among the encircling motorcycle
escort was the guy with the torch. I had to miss it 'cuz I was VEing
(1 new Extra, 1 Tech and 1 Tech Plus). So, here's my contribution,
the torch's current position (as of 8:45 last night) is 40:48:33 N /
73:57:38 W +/- one day's running, which puts it somewhere in New Jersey
right now, but still closer than Albany!

73 de Alan N2YGK

[in New York County, NY, where we proudly support diversity and

I find this Java topic to be highly stimulating, and it never ceases to amaze me how imaginative
the people on this sig are. Either everyone here has overly active thought process' or to much idle time
on their hands. So let me see if I can add to all those synapse flying around those unreal net's.
Have you heard about ActiveX? I know how everyone loves Microsoft and they way they get into
everything. ActiveX is MS's answer to Java and with the Beta of Internet Explorer 3.0 available it
look's as
if Netscape has some stiff competition. I've encoded some snippet's about ActiveX from a review I found
on C/Net.

ActiveX works as a kind of framework that runs small programs and can control the way you interact with
the computer. This architecture permits Web pages and the browser itself to be highly customizable.
These new objects are small, since they don't require a traditional browser to run, and nimble, so
you'll see better overall performance when using your browser.

Over time, more software applications will take advantage of ActiveX. That's because ActiveX components
are available to the entire operating system, so you'll see more programs become Internet-savvy over the
coming months. Software developers can write one set of code for productivity software--and easily snap
in Internet features. Internet Explorer 3.0's ActiveX core allows the browser to become a highly
customizable and programmable interface for the Internet, intranets, multimedia titles, and your own
work. Here are the parts of ActiveX you need to know about.

ActiveX Controls: These are small programs embedded in Web pages, and they can control other programs on
your computer. The ActiveX version of OLE controls are stripped down and more lightweight than previous
incarnations of Microsoft's OLE technologies.

ActiveX Scripting: Scripting supports both JavaScript and VBScript (Virtual Basic). Scripting is like
programming, but scripts are included within HTML pages to perform simple tasks and to link ActiveX
Controls, Java apples, and other components. <Picture: click here>

ActiveX Documents: These documents are from applications such as Word or Excel but can be viewed or
edited from within the browser. With some programming, any software vendor can turn their files into
ActiveX Documents.

657. GPS display kit available

From: J Goldberg <j@harper.com>
Date: Tue, 18 Jun 1996 08:38:26 PDT
To: aprssig@tapr.org
Message-ID: <9606181538.AA00339@harper.com>
Rendered body type: text/plain

I've gotten several requests for info in the last few days,
so perhaps a reprise of this previous message would be valuable
to the list...
73
j, kd6pbh

The KD6PBH GPS display is a compact unit which shows latitude,
longitude, UTC "zulu" time, the number of satellites and the computed
Maidenhead Grid Square location. As input, the unit takes 9-24VDC and
a serial connection from a GPS receiver which outputs the standard NMEA
GPGGA sentence. Output is provided on an LCD display with 2 lines and
16 characters per line and LED backlight. The 6-character grid square
computation is valid for any North American location.

The heart of the KD6PBH GPS display is an MC68HC705J1A microcontroller in a 20 pin DIP package. This receives the serial input, drives the LCD display module, and computes the grid square from the latlong. Other components include the smart LCD module, a serial receiver chip, on-board power regulator and LCD bias voltage generator. The RS-232 receiver chip has been shown to work with commercial GPS receivers (e.g., the Garmond 45) which can output GPGGA messages on their serial port. The unit consumes 12-15 mA with backlight off and roughly 50 mA with backlight on. Firmware for the micro is burned into on-board PROM.

The kit includes all parts, a PC board, programmed microcontroller, instructions, and the LCD module. Not included in the kit are the external cabinet and connectors for your application. Several folks have used the blue plastic Radio Shack box measuring roughly 1.25 x 2.5 x 4.5 inches, with Molex and/or DB-9 connectors.

The kit costs $45 including tax. Priority mail shipping is $5 more. (If you prefer or require another shipping method, please send me email and I'll get a quotation.) You can reserve a kit by writing email to j@harper.com, calling 619.693.9046, or even sending USMail to

J Goldberg
Harper Technologies
P.O. Box 26910
San Diego, CA 92196-0910

To order, please send a check to the above address. (At this time, I cannot accept credit card orders.) Please allow 2-4 weeks for delivery. If you have reserved a kit in advance, your order will be given priority and filled more quickly (and often from stock within a couple of days).

> determine when to take a bearing.  Also I feel the cars current heading
> needs to be reported at a higher rate than the DF info (especially on curvey
> roads).
```

APRSdos REPLY COMMENT: Yes, now I see. THe GPS will overflow the buffers. You have a good point about needing to see the GPS data inbetween DF fixes!

1) Re-wire the above to have TWO momentary switches. Push one for fixes when needed, push the other for bearings...

2) Use the GPS and a standard HSP switch. THis will let APRS control the GPS posits. THen push the button for the DF data.

In all cases, you must configure for one port operation (TNC) whether you use it or not. THen tell APRS to use SPM or HSP mode for the GPS and then set the DF mode to DFjr form the alt-SETUP-DF menu...

APR COMMENT: THe packet does *not* have to be valid to be detected. My KPC-3 with software DCD will detect the *noisest* packet signal imagniable. SO the noisy packet would be muted. It does have to be near full quieting to be "decoded", however...

ATTN: SPEC TRACKING EVENT...
   Noon Saturday June 29th, the Solo Transpac-96 Sailboat race will start, from San Francisco to Kauii, Hawaii.
   Mike Jefferson/WD6EHQ alone and aboart the S/V Foxx Fyre will be passing positions, twice daily, to Bill/KB6LFM in San Leandor, via Pactor on 14065.

```
   Bill will then plot and DR them on APRS and they will be sent on to Yacht
clubs by FAX and on Internet. Aprox 20 S/V will be involved.
   Also they will be uplinked and Gated on 10151/LSB on APRS and possibly on
7085/LSB, for all to see.
   This is a solo single handed race and will take about 20 days, so info will
be posted on APRS daily, conditions and QSO's permitting.
   Other info on Internet at: http://www.wingo.com.80/sss
Anyone wishing to listen in and help out are welcome.

   73's & Enjoy, Bill/WB6LPG@KA6EYH.#NOCAL.CA.USA.NOAM

Not really.  The 720A *is* computer controllable, *and* does use the ICOM
*standard* interface (albiet, the ICOM standard that was in effect at the
time the 720A's where manufactured - c. 1980).  It's a *binary-digital*
interface via a bank of data-lines at the rear of the unit.  Obviousely,
this is not RS-223.  There have been computer interface systems designed
and published for the unit.

Bernard wrote:
>My idea is to build the amp directly on the ground plane of the QST patch
>antenna. One replaces the aluminum ground plane by a PC board and etch (or
>just grind) the striplines right on that.

Don't forget that you'll have to be on the BOTTOM of the ground plane.  If
you try to put the amplifier on the top of the GP (i.e., between the GP and
th "patch" you'll change the characteristics of the cavity that makes the
antenna work.  Not good.

If you use double-sided G-10 or FR-4 PC board, 0.062" thick (1/16" - very
common), a 50 ohm trace is about 0.120" wide.  You should have at least
twice that as clearance between it and the ground plane on the same side as
the trace.  Where the MAR-6 mounts, the GP can come right up to the hole.
 The two GP (top and bottom) will have to be connected together in many
places, especially right at the ground pins of the MAR-6, and along the edge
of the board.

Also, remember that you can't use double-sided board for the "patch."  Use
single sided (or etch one side off), and make sure that the copper side
faces the ground plane.

666. 2-way MIC-E?

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 18 Jun 96 18:12:33 EDT
To: <aprssig@tapr.org>
Message-ID: <960618221233_71301.3106_FHJ46-5@CompuServe.COM>
Rendered body type: text/plain

```
Maybe with my interest in the MIC-E a recent happenstance, I could have missed
some prior dialog, but...

Has there been any discussion about a 2-way MIC-E? The MIC-E sends status
codes, but it would be even better to have the ability to 1) acknowledge a
changed status; 2) activate indicators (or even a limited text display); 3)
remotely activate/deactivate certain status codes.

I have a specific application in mind for the MIC-E in a large-scale annual
public service event, but hesitate because of the risks involved in giving
people "panic buttons" that can't be turned off remotely. Also, one of the
advantages of a simple status system is to cut down on voice traffic, but if
every button push prompts a voice acknowledgement from the net control in order
to confirm, then we've defeated the automated system.

Food for thought?

Rendered body type: text/plain

Sam, WJ8T, writes:

>Do you or your users now "put up with" folks who's signals are less
>than perfect?

Certainly. But not any that contain packet bursts at every unkey.

>From what I have seen at Dayton, the burst from a
>MIC-E is very short.. Shorter than your average packet because the
>TXD is gone.

And also because of the compressed format.

>Wonder if you have heard the signal from a MIC-E module.

Admittedly, no. But I remained concerned - concerned enough to get a MIC-E and try it for myself. No offense to our venerable leader and main "idea guy" around here, but we do have a track record of pressing the limits and using tech specs to create "good enoughs" that aren't.

>The burst is not as offensive as 1/2 of the "courtesy" tones I hear on
>Repeaters already.

Pretty shaky standard for comparison! ;-)

Maybe "offensive" is a matter of taste. I know that I don't like to listen to packet on voice channels, and bristle every time I do. I additionally have some exposure to a data-burst-on-unkey system, implemented by Burlington Northern Railroad a decade or more ago. Even with a tone pair that is "milder" than the pair we use, I still find it obnoxious and distracting.

>PLUS my TNC's regularly decode signals in the
>range of strength in the "comfort zone".

I still think that this is optimistic. I asked my neighbor and local packet guru (who's on the TAPR board, by the way) about quieting requirements, and it was his response of "pretty quiet - S7 or better, typically" which prompted my questioning the DCD approach, aside from my own experiences.

>This will get people asking questions on
>what the Burst is.

And open a whole can of worms about packet bursts on voice machines. On a closed repeater this is no big deal and would be a good way to "advance the state of the art" within a finite community. But on an open system watch out for the lids, kids and space cadets who suddenly think packet's ok on the voice machine. "Do as I say and not as I do" takes on a whole new dimension when you don't have your user base on a tether.

>> 1) 9600 baud.
>
>Plus, the Signal quality needs to be better than at 1200Baud. The
>comfort zone will have to be the easy-chair zone.

True. I don't see this as a problem, but, then, I'm a strong advocate of moving the packet community to 9600 as the preferred standard. 144.91-145.09 is bursting at the seams and we've got to get real and adopt a denser protocol.

>>DSP would reliably pull the tones out of the hash.
>
>I think the hash won't be as bad as you think.

The hash I speak of is the background noise in low-quality signals.

>Isn't a seprate Data Channel the same as a stand alone tracker on
>145.790 Mhz??

Exactly.

>The MIC-E is NOT blind.. It has simple busy channel monitoring
>capabilities...

I stand corrected, then. Good show. We just have to keep people from using MIC-E's and trackers with transmit-only setups like the Agrelo modules (sorry, Joe!).

```
>...that would work wonderfully on a Voice Channel.

And we're back where we started - I'll reiterate that I don't like mixing
analog voice and data on the same channel without the data content being
completely transparent to voice users who aren't participating in the data
system. This includes things like "CTCSS when voice" systems, which requires
the user to know the tone and its purpose. The uninformed user should not have
independent operation negatively impacted by a co-channel data system, and the
MIC-E system as it stands doesn't meet that need.

Understand that I'm not at all against the MIC-E, just advocating that it needs
a bit of fine-tuning. As existing, it is an excellent (actually, *great!*)
system for a closed environment, where all users are at least appraised of its
presence if not actually participating. But on an open, general-access system?
Not a good idea without some more refinement.

And this dialog gave me an idea. I'll post separately...

See you there.

To me, the MIC-E sounds interesting just because it operates with an
existing radio and antenna.  That would certainly make it more viable for
large-scale use for, say, Skywarn.

>

Do I understand right that the MIC-E sends its burst at the end of the voice transmission? If so, then there would be *no* channel monitoring needed as it would be piggy-back on a transmission in progress.

Rendered body type: text/plain

I have two computers that use two systems for extending the com: port situation. One computer uses a Hayes ESS card which has an extension to the 16 byte buffer that the 16550 offers: it has 1k bytes of hardware buffer on board, and also has a multiplier that allows 4x and 8x of the present baud rate (115 kbaud x8). I don't run that fast, but do make use of the COM3 or COM4 extension which can be IRQs of beyond the 4 and 3 that are the default.

The other computer has a com card with two 16550 chips on it. They can be any com: port, up to 10 I think, and can be any IRQ up to 13 I think. This is nice, but the PC will still run out of IRQs fairly quickly, especially if you have a sound card. I use this one to give me com3 and com4 so I can run WISP, the satellite program, which runs my TNC and my TAPR TrakBox. I also have a mouse and a phone modem on the other com: ports.

I got both of these cards locally (Fort Lauderdale) at Comp USA and Computer City. These are two large computer stuff outlets kind of like Kmart for the computer folks.

This stuff is available, and I didn't pay more than 40 dollars for the dual 1550 card and 80 dollars for the Hayes ESP card.

Well, the way things look, nothing written in ActiveX will be run on my computer for a
very long time.  The reason is because of Microsoft's constant insistence to create
new standards, rather than extend and enhance existing ones.  (I guess that they
didn't learn from IBM's experience with Microchannel.  A very good bus, mind you, but
not really worth the premium price.)

Also, it appears that M$ has absolutely no interest in supporting the machines that
are already out there; particularly the *nix market.  Anything that is going to be a
serious contender in the  Internet market simply HAS to be available for the major X
platforms (Sun, SGI, etc.; and it's not far from there to BSD and Linux), or it won't
get used by those with the influence.  Sure, they'll have the college crowd running on
their machines in the dorms, but that's not where the bucks are.

Enough of that for me....

678. Multi Com Ports

From: "Mike Walker" <mwalker@interlog.com>
Date: Tue, 18 Jun 96 21:57:43 -0400
To: "APRSSIG" <aprssig@tapr.org>
Message-ID: <199606190159.VAA14463@gold.interlog.com>
Rendered body type: text/plain

```
If you are using os/2 and are attempting to access com4, you don't need to
address it  as x'2e8' (I think this is the stardard address).  I use an ATI
Mach 64 card and had to change my com 4.  I found that x'1e8' does me just
fine.  My modem runs off that port at irq 11.

My com 3 is x'3e8' at irq 12 and com 1 and 2 are normal.

Some os/2 shareware programs allow you to move your mouse up to com3 or above
so you can free up 1 and 2 for dos applications.

Hope this helps

mike

Actually, I'd prefer to port the GUI version, rather than try to recompile the
keyboard driven version.

The Programmer's Workbench and compiler are pretty good at semi-automated
porting of Windows code to OS/2.

I downloaded it today, between server crashes at tobo.ucsd.edu (getting some long-baseline observations for a littpel GPS surveying project in Azerbaijhan), and I plan to install it tomorrow morning or Thursday. I'll let you know how the buglettes are. I *am* installing it in a seperate directory so I can go back to 1.1B if it flakes.

683. Ignition noise !help!

From: Joe DeVille <jwdstu@westga.edu>
Date: Wed, 19 Jun 1996 00:28:56 -0400
To: aprssig@tapr.org
Message-ID: <1.5.4.32.19960619042856.0068bc68@160.10.4.2>
Rendered body type: text/plain

Ok, sorry if this is a little off topic, but it directly involves APRS.

I am in the process of trying to get a stand-alone tracker in my car. I am using the following equipment:
Magnavox MX-4200 GPS
MFJ-1274 TNC W/ v1.2.9 firmware (GPS compatible--the new one).
Clegg-22 FM Transciever (oldie, but goodie!)

```
All this is wired into the fuse box via an unused fuse contact.

Here's the problem:  Ignition noise.  It does the following:

1. My TNC DCD light stays on, so no packets are TX.
2. Distorts my signal somewhat.  It isn't too noticible on voice, but it
seems to be more prominient on packet, probably due to the radio-->tnc cable.

I tried running the TNC on batteries, and that solved the problem, but I
would much prefer to run it off the car electrical system.

Does anybody have any ideas on solving this noise problem??  I don't know
beans about ignition filtering.  I haven't been able to find any
commercially available solution either.

Thanks in advance!

> but PLEASE NO MORE ATTACHED E-MAIL FILES!  Thank You

I too got the file as did everyone else, it's not the SIG's fault, a user
did it. I suspect everyone got it because the sender didnt pay enough
attention to whom he sent the message and it got sent to the SIG. Hey stuff
happens!! We're all new once in a while, granted it happens here
occasionally but usually not from the same guy more than once or so.

   I suspect if every HAM here flamed a new HAM like they do a person doing
accidently sending the attached messages on the SIG, there would be a LOT
less HAMs to talk to!

  Remember this is nicknamed the Information SUPER Hiway, it isnt always a
walk in the park. Have some patience out there. If I and others replied to
EVERY message I thought was useless and wasted bandwidth there would be 3-4
times more messages I suspect.
  Newbies here should practice sending attachements with messages locally
before  posting to the SIG I suspect. As far as not having an email reader
that wont handle attachments correctly. Get a new reader that does. I was
lambasted, heckled, flamed, etc about my Windows 95 Explorer sending
attachments accidently that I didnt even know was being done. I was in
essence FORCED to find a different E-mail utility or not post any messages.
The lesser of 2 evils was a new browser. Eudora version work fine and are
easily found. There's really no excuse for not being able to find a good
reader that will handle attachments. Before complaining about someone elses
lack of expirience, make sure you got your bases covered.

  This is MY opinion, please reply directly and not via the SIG. Any
disgruntled replied can be addressed to me by using the DELETE key.

Okay...okay..okay..... So, I was one of the group that "jumped on the
bandwagon"
about moving the APRS mega bulletins.  Well, hey!  I was just looking at
alternative
solutions.  Whether or not it was to a USENET group or to some other method,
there
must be another way to break these down to a more usable level.  One in which
we
could request subscription to only certain criteria within the APRS msgs.  No
offense
guys & gals, but I'm not interested in the Florida GPS info and about 3/4 of
the msgs.... But, there are some that tweak my curiosity.  So, I keep the
bulletins
coming.  However, I do a lot of deletes without even looking at the text, if
they don't
qualify to my interest level.
 Let's see if we can find a way to solve this.  Yes... these requests hit
every few
months.  But, they are valid.  Don't keep bitching about them.  Find a
solution...jeez.

The TAPR mailing list software supports 'digest' mode.  Digest mode
generates a periodic message each day containing multiple messages,
instead of sending you each message individually.  If you feel close to
information overload, you may find digest mode to be very useful.

If you would like to change to digest mode, send a message to
listserv@tapr.org containing only the following line:

   set APRSSIG mail digest

Enough said!

>OK, who is the JAVA hacker out there?
>
>How do you open serial ports in JAVA on 95 and MAC?
>
On the Mac, you have to write a native code object, actually pretty easy.
Don't know about windows.

I think, though, I need to restate my plans for javAPRS. I will not be
writing a full featured version of the APRS protocols. My desire is for a
set of Java applets that allow for a much greater presence of APRS on the
WWW. All of my released programs will be cross platform Java, which means
NO serial port access.

If someone else wants to re-invent the wheel and do a full APRS version
in JAVA I'd like to work with them to make our objects have a common
interface, which would benefit everyone. I have no desire to write and
support a monster set of features in a full APRS. javAPRS will strictly
be things _I_ think are cool...but please feel free to attempt to
convince me of those things _you_ think would be cool!

Mostly so. If the user hasn't transmitted in a while, a timer will cause a
transmission, too.

Yes, I did. I opened the MA/Com amplified hockey puck (65.00 I think) and
it had a cute little cavity type filter. (At least that's what I think it
was) It looked like a really miniscule interdigital filter like we use on ATV.

They use their commecrially available 1575 (or whatever)
GPS-preamp-on-a-chip   ($8.00, I think) in this unit.

MA/Com sent me a sample chip- I gave it to KA4IIA.   Folks building GPS
preamps wight well look at this chip, but personally- I'll buy any future
ones commercially. I don't have the time to try to homebrew something that
is potentially this troublesome. Especailly when I can buy a Trimble puck
from Paccomm for 65.00 or whatever it is.

By the way- I took the cover off a Motorola active antenna too. The
electronics were not visible, they are underneath the patch, which is sealed
in metal.

APRSdos REPLY COMMENT:  One other comment about MAPFIX..  BILL WAS
RIGHT!  Mapfix does create some 45 degree shortcuts when you do the
TASKS-SCRUNCH command.  So my recommendation is NOT to use TASK-SCRUNCH
on any of the 100k maps.  If you need to remove points, go to the red
roads and smooth out all the jaggedness.  Next look for an area of
lots of straight blocks where you can re-draw the grid of streets with
long straight lines instead of the block-by-block organization of the
current data.  I draw new yello roads over the whole block area, then
delete the gray points underneath.  When Im done, then CHANGE-COLOR back
to gray...  Do NOT use MAPFIX25 for deleting the LAST two points in a
feature, or it will creat a single point.  Then you must use TASK-CLEAR
to get rid of it...

```
Hello all,

Looking for some info on the Garmin GPS-75, specifically the connection
information for the cable (I know the red and black are +12VDC and
ground respectively), I need to know the data out leads, are they brown
and white? What are the Blue and Red w/Blk trace leads?

Also, has anyone connected a TNC to a TM-742A and if so any hints/kinks?
I plan to make all connections to the rig thru the RJ-45 connector.

My complete mobile setup will be;

Kenwood TM-742A
Kantronics KPC-3 w/Ver 5.0 firmware
Garmin GPS-75 rev ?? firmware
Agrelo DFjr w/Multi-port adapter
IBM Thinkpad 701C running DOS APRS 76d
TEKK KS-960 UHF Data radio (9600 ready)

Any help would be appreciated.

thanks, Bob

Last week I found myself in a window seat of a Delta DC-9 flying
from Atlanta to Washington, D C.  About halfway through the
flight, I decided to check out my Garmin 45.  It had been used last in
the South Florida area.  I placed the antenna next to the window and
after about five minutes it began to acquire satellites.

Even with the encouragement a couple attractive flight attendants,
the unit would not lock, not even after displaying signals
from five satellites.  Kind of disappointing.  Does anyone know why it
did not work??  Has anyone had success?

I was assigned an isle seat on the return trip.

> work, shouldn't it?????

If things are implememted as suggested, Voice users will not even hear the
data packets on the repeater. Data packets will only be heard over
repeaters that are not setup for voice/APRS operation. What's the
problem? If people are worried about data bursts over non-APRS
repeaters, just turn off the encoder when using such systems. Kind of
like people complaining about "sub-audible tones" on repeaters that don't
require them. Can't please everyone.

I'm not sure about the Garmin 45, but a lot of the low cost units are
specifically designed so that they will not work in aircraft. I guess they
are afraid of liability .. either that or they want to soak the aviators
(myself included) with specific units designed for avaition use. These
avaition units, as you might guess, are much more expensive, although they
usually include databases that are useful to pilots, but not available on
the low-cost units.

The Brown is data + and the white data - . I think. My manual is at the
house. I'm sure that's right.
BTW, I too am setting up my mobile with almost exactly the same
equipement! Except I'm using a MFJ Data Radio, and a 486 Grid KomPooteer.

My semi-educated guess would be that 1)you were traveling too fast for
the GPS-45, 2)I think the limit of speed in the GPS-45 is 100 knots or
something like that.3)The aircrafts metal body was hindering the signal.
By the way, I'm suprised you didn't get in trouble for firing it up in the sky.

Anyway, that's my 2 cents worth, not a penny less, or a penny more, hi.
And you know what 2 cents can buy these days;-)

modified TNC's that
---SNIP!

Ok, I can see all sides here. But if we use CTCSS then those with UN-modified TNC's can't play easily... Also, on a simplex net, if you're using a radio without a S-meter, you can't easily tell if a station is transmitting if it's using CTCSS instead of the standard audiable tones TNC's use. I agree though, that a faster "audiable" data rate would be a good thing. But I can't expect manufacturers of TNC's to change the "standard" 1200 baud rate anytime soon.

Lets imagine a small scale use of the Mic-Encoder. 15 - 25 stations participating in a Search & Rescue simplex net. Just having a Mic-E on each radio would cut down on standard voice transmissions by a significant number. Thereby leaving the channel fairly free for queries and emergency info.

I know that a LOT of traffic is passed regarding, "Where are you", "Leaving/Returning to Base", and the ever exciting every 1/2 hour "Are you OK" report. As a Net Control Station, having each station report in automatically and having someone able to push a button to report standardized info, would save me a lot of work.

Cheers, Bill Neal - N0NSA

> Please enlighten me.

1. You use L1/L2 correlations to model and subsequently cancel the effects of the ionosphere on propragation. Or you apply a locallly derived model in post-processing.

2. You place a base station on a precisely surveyed point, and have it derive corrections to the satellite determined pseudorange and pseudorange rates for each spacecraft.

3. You apply these corrections, either in real time or via post processing to the data collected.

4. You collect point data for some period of time, say, 20 minutes, to allow both the roving receiver and the base to have an opportunity to collect adequate data from at least 4, and prefferably more, satellites over common time periods. The 20 minute number is a Trimble Survey recommendation for Fast Static survey work.

5. You obtain and apply precise ephemeris data to the received data, and incorporate that into your post-processing.

Takes time. And money. The hardware we use is on the $12k-$40k range, depending on accuracies we expect.

Gerry

The Icom uses Rs232 TYPE interface and they sell you a CIV unit to make more
money.  You can easily convert the levels.  I think MFJ sells them now. About
$24.00.  I guess everyone thinks they need the converter...
Thats why they sell more..

Mike

712. Garmin 75 cabling info

From: Frank McJunkins <fmcjunki@cks.ssd.k12.wa.us>
Date: Wed, 19 Jun 1996 16:57:29 -0700 (PDT)
To: n2iph@cyberenet.net
Cc: aprssig@tapr.org
Message-ID: <Pine.SUN.3.92.960619165000.6207A-100000@cks>
Rendered body type: text/plain

```
Pin 1/RED  +4 to 40 VDC
Pin 2/BLACK  Ground
Pin 3/BLUE  External alarm
Pin 4/BROWN Data output
Pin 5/WHITE Data input
Pin 6/RED-BLACK  No connect
```

When hooking up an external alarm, my diagram shows that the + side of the external alarm device is hooked to B+, and the ground side of the external alarm device is hooked to the BLUE (External alarm) wire. They also show that data output (data TO a NMEA device) is through BROWN and the wire is grounded with BLACK hooked to the shield/return of the data output line. I also note that the book later says that B+ can be 5 to 40 volts DC. I havn't run mine under 12 yet. It also stated that the external alarm or relay supply maximum is 100 ma. and anthing over 100ma may damage the Garmin 75. Note that the Garmin 75 will supply NMEA 0183 but NOT the type 2.0 signal needed to drive the KD6... 2x16 line display discussed on this sig. (I learned the hard way).

Ths 45 will not work above 99 knots.

IMPORTANT: You are not allowed (by law) to use any electronic equipment on a airliner unless specific permission has been given by the airline operator. (NOTE: the "operator" of the airline is *not* the pilot, it is the company) The specific permission is usually a list of permissable devices (laptop computers and so on)

```

OK here is the scoop. The brown is data + out. Red is 5-40vdc + in. Black is Ground for BOTH the unit and data - out! Blue is an alarm (negative) 100 mA max. White and the Red/Black are "for future use".

Hope that helps.

I think that this is a great idea not only for APRS but for amateur radio. I have been a ham now for 19 years and have seen the decline we have previously spoken about with Public Safty units needing us. I have also been a Sheriff's Deputy, and EMT over those years and acted as a volunteer for Forrest Fire Services, Search and Rescue (High Angle Rescue), and Emergency Management. We need to change with the times and involving ourselves with the actual org. is probably needed for Amateur Emergency Communications to survive. The mic encoder (heck even a GPS back then) sure would have helped on many a search!

I know I opened a can of worms... Let 'er rip

Joe,

I'm not a mobile packeteer, not yet anyway. I did have trouble about two years ago with a 2-m transceiver whose 2-conductor power cable I routed next to the factory harness along the right front of my Toyota pickup out to the battery terminals. It was a nice installation since it was hidden under the fender splash guard, I didn't have to drill any holes, etc., etc. But the alternator whine was real bad. I should have twisted the pair of wires and routed it away from the harness. Hind sight!

Before abandoning the "nice" installation job, I tried one of those Kenwood 15 Amp inline filters. Couldn't tell any difference. Then I referred to a Grounding and Shielding Shortcourse Handbook from Professor VanDoren at the University of Missouri-Rolla (one of my alma maters). UMR's url: http://www.ee.umr.edu

To make a long story short, I resorted to a "local" ground for the transceiver and the noise was no longer audible to me or my contacts. Being the fuss-budget that I am and not wanting to cut the radio's pigtail or harness, I left the filter inline (the vendor would not let me return it anyway) and cut the ground lead that bypasses the inductor. Thus, I will have a nice clean installation for another (future?) radio should it not require the local ground for noise reduction.

I don't know where you are getting your ground or where your fuse box is located (under dash or under hood?). If you are routing the power wiring near noise sources such as engine controllers or ignition/alternator harnesses, you might try a different rounting path and/or a different ground location (i.e., a frame ground vice a connection directly to the negative battery terminal) before investing in filters.

Good luck & 73,

Jeff Bledsoe/N5YMV

My understanding is that the GPS-45 is internally disabled at speeds above 90 mph (to preclude its use by the private aviation folks, who are forced to by a more suitable (read pricier) model).

____

Subject: [APRSSIG:2165] Joining the mile-high club
From: aprssig@tapr.org at esdigate
Date: 6/19/96 11:44 AM

Last week I found myself in a window seat of a Delta DC-9 flying from Atlanta to Washington, D C. About halfway through the flight, I decided to check out my Garmin 45. It had been used last in the South Florida area. I placed the antenna next to the window and after about five minutes it began to acquire satellites.

Even with the encouragement a couple attractive flight attendants, the unit would not lock, not even after displaying signals from five satellites. Kind of disappointing. Does anyone know why it did not work?? Has anyone had success?

I was assigned an isle seat on the return trip.

Rendered body type: text/plain

If you know the GND wire then you can usually find the RX (receive data) wire with a scope or even a meter. A scope is easy. Just ground the ground lead to the ground pin and touch each other wire in the bunch. If all you have is a meter then look for the lead that seems instable. That is most likely the data out wire.

The Garmin also has a data in wire which will be stable.
The wire connector for the Garmin is:
1. Red: 4 - 40 VDC
2. Black: Ground
3. Blue: External Alarm
4. Brown: Data output
5. White: Data input
6. Red/Blk: no connect

I'm not sure what the "KD6... 2x16 line" is, but my GPS-75 with software version 2.33 DOES output NMEA version
2.0.

First, you're VERY lucky it didn't get confiscated..

Second, the GPS-45 will NOT go aeronautical mobile as it has a maximum speed of 99 knots. The unit will still act like it's receiving, as you noted, but it will NOT generate data. There is also an altitude limit that is built in but I can't remember what that is....

SAREX supports APRS!

Get ready guys, and spred the word. APRS is permitted via the SAREX ROBOT during the long duration mission launching Thursday morning. Although it is doubtful that SAREX will be activated for several hours, By Friday, you should consider leaving your APRS station on while you are at work, to see if you capture any APRS packets via the Shuttle. Most passes will be daylight passes. This Weekend (Field Day) will be a Zoo for sure!

DOWNLINK 145.55
UPLINK   144.49

*********** MAKE ABSOLUTELY CERTAIN THAT YOU ARE NOT TRANSMITTING on 145.55!

If you are a home QTH, then I would use the SPACE mode which will put you on the map in grid square mode (no ICONS) with the shortest possible packet.

If you are Mobile, then I would use the standard APRS format, so that everyone will see your MOBILE ICON and your speed!

If APRS works well, and things are looking good, then I think those of us that are GPS mobile should take it as a challenge to get an APRS MOBILE packet through. I will see if we cant get some kind of special "GPS MOBILE" list for special recognition...

****** REMEMBER TO SET YOUR MOBILE TO TRANSMIT ON 144.49 MHz.

Note, your chance of hitting the Shuttle mobile with 50 watts is about the same as from your QTH omni antenna no matter how high it is, since both are line-of-sight to the shuttle. The mobile does NOT have its usual height disadvantage. And it even has a much lower loss cable run...

Another advantage of operating from your GPS mobile is that you will
produce significantly less QRM to other local stations who
may not appreciate your APRS posit...

 It didn't work because the plane was travelling in excess of 99 miles per
hour. If you were watching it as you landed, as soon as the plane came under
the 99 MPH limitation you would be seeing data. The Garmin 45 has a speed
limit built into it. There's no way around it as far as I know of. BTW, this
was a detailed topic here a few weeks back.

Attn: Joe DeVille..and all Magnovox MX-4200 GPS Users..

Have found the subj GPS MX4200 to be generating considerable RF interference
to adjacent VHF receivers. Using PK-12, easy to set up for GPS use, Alinco
DR1200T adjacent to the MX4200. Get a full scale signal strength reading on
the DR1200T and have Squelch set real high, and do not hear numerous APRS
```

```
packets, on our 145.01 operating frequency.
  My old Kenwood TR7600 for voice on 147.285 about 2-3 feet away from the
MX4200, has a half scale S-Meter reading when the MX4200 GPS is powerd up.
and very poor voice reception except on very strong signals.
  Turn off the GPS and reception and signal strength indications on both the
DR1200 and TR7600 disappears and reception is normal.
  Suggest moving your MX4200 as far away as possible, going to try it, or
check and see if tha GPS is the cause of reception problems. Also it will
send the GGA sentence, but not the GVT sentence. This is a borrowed GPS.
  No similar problems with Garmin-45 or Motorola/Traxar GPS, connected for
Stand Alone tracking.
  Anyone else have similar problems with the MX4200..???? Advise

    73's & Enjoy, Bill/WB6LPG

Source code for my US Census TIGER/Line 1994 to DOS APRS format maps
program is now pointed to by:
        http://www.cloud9.net/~alan/ham/aprs
Before you go and download it, please note this is a C program that runs
on a Unix system (only tested on Linux).  Don't expect it to work under
DOS.  The program is freeware (GPL'd) and includes rudimentary documentation
which includes some pointers on how to actually obtain TIGER/Line data.

I wanted to reorganize the code into something less embarrassing but
decided I'd better leave it non-broken instead:-)  Please be gentle.

There are some sample maps there too.

Oh yeah, and thanks to the heads-up from Barbara, I've confirmed
with Census bureau that the datum is NAD27 and I haven't yet added
the WGS84 translation.  Also, I hear the next TIGER/Line data is due
out near the end of the year or so and will use NAD83 (which I think
is the same as WGS84??).

I think I might be available for-hire to generate maps if there's interest.
It's the only way I would ever to be able to actually own a GPS myself:-)

Don't have a  Magnavox but I do have the Motorola Traxar and
have had similar RFI problems. I suspect it's not the GPS itself
that causes the RFI but rather the low class hook up job I did
using non-shielded cables and connectors. If I operate the
Motorola on internal batteries with no RS-232 connection, the
RFI goes away.

Shortly after I received my pair of MX4200s I came to the conclusion that these units (or at least many of them) had been returned to the Magnavox for repair. Some units may have been repaired others may never have had anything wrong with them. These units may also have been part of a lease deal. In the end they all wound up in a big crate and Gateway purchased them as a bulk deal then opened the crate and sold the boxes as-is. Some folkes had to buy several and swap parts around to get a working unit, others worked out of the box, and still others were DOA.
My working model generally works fine. No RF interference to adjacent VHF receivers. I use mine with one of WB0NOO's transmitters for a standalone tracker. I had it running as well as a second tracker in the van all the way to Dayton without a problem. On the way back it decided not to send any coherent data any more. When i got home I attached the computer and sent a few macros to stop all data then start data, then it worked fine. This has happened a few times since. if this had happened to a GPS I purchased for $2000it would be back to the factory in a hertbeat. For a $25 GPS (and the factory out of business) it is an annoyance that I learn to live with. Knowing that there is an intermittant problem will make me use this tracker for fun but nothing serious.
I suspect that the RF interference to adjacent VHF receivers that you are experiencing is why that unit was returned. I suspect that most people that purchased these have found some anomily that had they paid $2000 for the unit they would be quite mad, since it was only $25 they will live with it or figure out how to fix it, all part of the hobby.
Thanks for the warning anyway, I am always looking for experiences that others have had with their MX4200. I still have one that does not work and I hope that someone will give me just the clue I need to get it operational.

735. NASA's Lightning Detection

From: Robert Kirk <kirk@neptune.gsfc.nasa.gov>
Date: Thu, 20 Jun 1996 10:34:22 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960620143422.006b75ec@neptune.gsfc.nasa.gov>
Rendered body type: text/plain

Looks like NASA's getting in the lightning detection business, or at least field testing a commercial unit. Below is a new press release from NASA Kennedy:

June 19, 1996
(407) 867-2468

KSC Release No. 75-96

NASA INTRODUCES LIGHTNING MAPPING SYSTEM TO COMMERCIAL MARKET

Despite being located in an area with the greatest amount of lightning activity in the United States, a NASA developed Lightning Detection and Ranging (LDAR) system has provided a safe, productive work environment at the Kennedy Space Center (KSC) and the Eastern Range since 1992. Now private industry and the public at large stand to benefit from the space age technology.

NASA has signed a Space Act Agreement with Global Atmospherics, Inc. (GAI) of Tucson, AZ, to begin joint work on development of an LDAR system that meets both NASA and commercial needs. The technology has commercial application in the electric utility, aviation, atmospheric research, commercial rocket launch, recreation, construction and meteorological industries.

"The 45th Weather Squadron at Cape Canaveral Air Station uses LDAR to accurately inform KSC of any lightning threats in the area," said John Madura, manager of KSC's weather office. Cape Canaveral Air Station and the National Weather Service in Melbourne, Fl are the only organizations currently using this system.

Current two-dimensional commercial systems only locate cloud-to-ground lightning. NASA's three-dimensional LDAR system also pinpoints the location and altitude of in-cloud and cloud-to-cloud lightning by measuring the exact arrival times of electromagnetic pulses.

"When you hear a crackle of lightning over your radio, you are listening to an electromagnetic pulse. Since the speed of light is constant, once we know the time of a pulse we can figure out exactly how far away the lightning is," explained Carl Lennon, KSC Information Systems Division.

The system detects the VHF or very high frequency radiation and maps the volume of the lightning activity. The result is a three-dimensional presentation of the local activity and the threat that it presents.

GAI designs, manufactures and markets commercial lightning detection systems that are used worldwide for collection, analysis, display and dissemination of lightning related information. They bring the expertise and resources to this partnership that are necessary to expedite commercialization.

"This collaboration between GAI and NASA brings together two organizations respected in this field of study and should benefit the public with an extremely solid new product," said GAI President, Pat Zumbusch.

The 2-year agreement does not require an exchange of funds, but does assign responsibilities to both parties. GAI will focus on improving the location accuracy, small signal detection, and flexibility of NASA's existing system. After reducing the cost of transmitting and displaying data, a commercial version of the system will be available.

NASA will operate the LDAR system, allowing GAI to compare their newly developed systems to it. NASA will also assist GAI with the design and evaluation of various system components and allow them to use existing equipment, facilities and weather data.

"This agreement is the perfect example of NASA working together with industry to bring space age technology down to earth," said Bill Sheehan, KSC's Technology Programs and Commercialization Office. "The space program, commercial market and general public will benefit a great deal from this project."

Just wanted to confirm some info for your file.  My Garmin 75 has software
version 2.22 and it will NOT support the GPGGA statement needed to run the
KD6PBH display.  However, it appears that software version 2.33 WILL
support the GPGGA statement.  I got Garmin on the phone again today and
found someone who apparently was more familiar with what they sold.  The
bottom line is that if I want to upgrade my software it's going to cost me
$80-100 !!!!  Now I'm beginning to see a negative side about Garmin.
After seeing the $90 price they want for a replacement antenna, and now
the humoungous ding for software upgrade, I think I'll start looking for a
Magellan.  Well, I didn't like the way they ran the I/O cable through the
back of the case anyway...   :)

To upgrade the software they basically have to change the unit! At least for
the "sealed" one (38, 40, 45 ...). Flat service rate is ~100$, not bad
considering you get a new unit.
I bet it's the same with Magellan.
Something nice with Garmin is that they do improve regularly the soft. I
would be garmin, I would stay with the same firmware: nobody would complain!

742. Garmin GA-26 Active Ant ?

From: schiers@ames.net
Date: Thu, 20 Jun 96 12:58:24 -0500
To: aprssig@tapr.org
Message-ID: <199606201800.NAA24886@tapr.org>
Rendered body type: text/plain

I am looking for recommendations regarding a better antenna for the Garmin 45 GPS. I am trying to figure out if the increased cost for an external active antenna is worth it. (When it stops raining I will check out the BlackJack by putting it on my roof, instead of on my dash.)

The GA 26 is pretty pricey...has anyone evaluated it compared to the passive BlackJack on the dash, or to the standard antenna with unit sitting on the dash?

Any other recommendations? Information on the Trimble/PacComm setup would be welcome, especially if someone can give me a before and after comparision. 73,

Just in case there is someone who doesn't know about it, there is a digest mode on this listserver that is perfect for those who don't like hundreds of messages in their in-box. It compresses all the little messages into a single long message with separators. So you get a single e-mail for every 20-30 sent.

The beginning of each message has an index of all the e-mail subjects, which makes it easy to skip right to the interesting (to you) stuff.

To change to digest mode, send the following message to listproc@tapr.org

```
        set aprssig mail digest
```

Regards,

Mel Muecke
KE6FQZ

P.S. I agree with Pat Bunsold WA6MHZ about including files. It is much nicer to send a personal message directly to those interested, instead of attaching files to messages sent to the listserver.

I think the high price is somewhat to blame on the case. I know the 45 has a nitrogen filled and sealed case. Just to open it, reseal it and pump it full of nitrogen is more expensive than your standard 'tkae off the case and pop in a new chip'. Possibly, the software upgrade involves SMT parts and we kno how much fun those can be......

746. SIG Reflector Issues

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 20 Jun 96 14:59:19 EDT
To: <aprssig@tapr.org>
Message-ID: <960620185919_71301.3106_FHJ82-2@CompuServe.COM>
Rendered body type: text/plain

```
Two cents' worth about two discussions regarding SIG issues:

1) YES, *please* don't attach binaries! They clutter the mailbox and in many
cases unnecessarily pump-up the archive. If they're of general interest,
download to the FTP site instead.

2) And I also vote NO on moving the SIG to USENET. I specifically do not
participate in USENET groups due to the abuses, particularly by the commercial
spammers. One posting to a USENET group will fill your e-mail with junk for
weeks.

Also, I've found the signal/noise ratio in the radio.rec.amateur groups to be
very poor. Frankly, there are some major lids who constantly pollute the
groups, mindlessly increasing message counts with specious flaming and "fight
baiting". We'd become yet another target of this nonsense. Moderation is not a
solution, either, as it results in debates over rules and "censorship" as well
as causing a lot of work for someone.

Anyway, moving the SIG into overt visibility will draw the attention of the
online vermin, unfortunately.

My personal solution to the mail volume associated with this popular reflector
is to not subscribe to the SIG, but fetch the archive every day or so. What
would be nicer is if the mail archiver packaged the day's messages into a
separate digest file, maybe kept for a week or so, so that it wouldn't be
necessary to download the whole month's accumulation every day. Or maybe a
SUBSCRIBE APRSSIG DAILYDIGEST, with one whopping e-mail containing the day's
traffic?

No. We already paid for it. NASA's charter requires technology transfer to the private sector whereever possible. This represents an example of that.

So do cardiac monitors, cardiac telemetry in hospital ICU stepdown units, fiber-optic monitors of blood chemistry and oxygen, cellphones, and a whole host of other technologies transferred from NASA research to the common man. Someone has to capitalize it and produce it so that we can all benefit from it.

Rendered body type: text/plain

OK!! Thanks to everybody for all the help. I went out to 'da Shack' and picked up a 20A noise filter, and it seemed to mostly solve the problem--at least the DCD light stays off when there is nothing on frequency now! Still a trace of whine on the signal, but it is at an "acceptable" level until I can further investigate it. I'd like to run the power cable directly from the battery, but I can't find a single place that anything runs through the firewall, and right now drilling is not an option.

As far as my MX4200, I got 2 and both seem to work, however I think the RF section in one is better than the other. Haven't noticed much of a RFI problem from them though.

Thanks to everybody on this sig, I now have a working stand-alone tracker.

Keep all those great hints coming!

> Here's the problem: Ignition noise.

Wiring into the fuse box is just asking for noise problems.

Try a direct battery hookup; just get a nice chunk of "zip" cord, run it out the door to the battery, and see if you still have the noise.

My favorite trick is to just thread the wire through the slot between the fender and the windshield, and through the door gasket. Beats drilling through the firewall.

I saw several replies of the 99 knot speed limit, but nothing about the DISTANCE you have travelled. I know that the Magellan units have a 300 mile "turned off" range before they have to re-acquire the almanac data; I don't know about the Garmin units.

It could be that your unit found satellite data, and was simply working to determine which of the satellites it was receiving.

```
ATTN:  seront and Alan Edmonds, et al.
Thanks for your input.  ONce again I would have to say that if Garmin
simply would have said...Hey, Frank, we're going to basically replace your
whole unit for the $100 to upgrade the software because there were some
board changes, I'd have said, Sure...  But they don't follow up on
anything!  One guy doesn't know what's going on and another one seems to
know, but won't give any other info.  They're going to have to start
learning some customer relations, I'm afraid.  I've lost interest in them
because of their apparent lack of ability to deal with me as a human being
who really believed in their product.  SO do you know for a fact that they
really do replace the whole unit, or were you just told that as a p/r
ploy?  Does the unit physically look different, and why do you believe
they really do anything other than put an IC in, or upload software?  I'm
just curious as I do (electronics) design work for a living, and have
heard all this mumbo jumbo before... I deal in fact, not BS.  Thanks for
any input.

I just realized, as a relay from space.. Imagine all the stations to get reflected. I will be running APRS at Field Day. If we can see it when it passes, the stations could POP UP around the country in droves... I hope! NASA has GREAT timing. This aught to be an INTERESTING weekend.

766. SAREX and APRtrak notes

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 21 Jun 1996 01:47:14 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960621012658.29997A-100000@arctic>
Rendered body type: text/plain

THe SAREX robot is configured to relay the special APRtrak position packets during this STS-78 mission. Stations running APRtrak should see successful packet uplink stations show up on their maps. For operating details, see the README\SPACE.txt file that came with APRtrak. The latest version of APRtrak is still version 0.5 dated in November 95 which was successfully used during the SPRE mission in January 96.

CAUTION: During recent testing, however, we have discovered that all versions of standard APRS after APRS74e will not properly detect a successful SAREX relay, and therefore should not be operated in AUTOMATIC SPACE Mode. Use APRtrak, or WATCH for your relayed packet and STOP transmitting when you are successful..

```
A beta test of APRS76e has been posted that hopefully solves this
problem.  It can be downloaded from tapr.org via ftp from the
tapr/SIG/aprssig/files/upload directory.  Get the file beta76e.zip.

REMEMBER.  Operate SPLIT mode, receiving on 145.55 and transmitting on
144.49 only when the SAREX Packet mode is operating.

Send three "control-c" commands and that will reset it to term mode and give
you the "cmd:" prompt. I know it is specified in the addendum for 6.0 but it
is probably buried somewhere in the fine print.

Hope this helps,

Bruce

Send it three "CTRL-C" in a row. (if it doesn't work the first time try
again -
the timing of the CTRL-Cs is important)

NOTE: This is similar to the way you exit from TRANSPARENT mode.

73 and good luck

Here's how to regain control of the TNC (2 ways!)

1)  Connect your terminal program to the TNC.  Turn TNC off then back on.  Hit
CTRL C  THREE TIMES in succession then hit ENTER.  You should get a TNC RESET
message and CMD: prompt.  You are now back in TERMINAL mode.

2)  Use the Remote Sysop function of the TNC by connecting to the TNC using
another station with the SAME CALL (SSID is not important.  Once you enter the
password code you are able to execute any TNC command.  At this point simply
send INT TERMINAL. This will cause the TNC to reset and you can plug in then to
do what you need to do.  This mode is particularly useful if you have
stand-alone trackers running and need to changes parms on the fly while the
tracker is operating!

Just got word that SAREX is not scheduled to be unpacked until
1734 EDT today (fri) so we will not see SAREX here on the east coast
probably until Saturday morning (first pass about 0920 EDT)...

And I suspect many passes will be voice..

If anyone has downloaded beta76e.zip and has any comments, please let me
```

know. If it looks good, then I will release a new version of APRtrak too.

P.S. Be sure to set CONTROLS-LOGS to ON so you save any data on
un-attended passes. ALso be sure to do a FILES-SAVE before exiting APRS
or APRtrak if you want to save what you got...

Dr. Kelso's data does not yet include STS 78 (23931). He has been updating
tle.new (et al) ~20:00 UTD each day, so look for it this afternoon.

In the mean time you can get the elements from JSC at:

        http://shuttle.nasa.gov/sts-78/orbit/orbiter/sighting/shuttle.html

Be careful with this data. It is very early in the flight and, thus the
elements have not yet stabalized. For example: the elements that I pulled
last night (internally dated as being 20 June 1996 ~21:00 UTC) were almost
1/4 orbit behind the shuttle's actually position this morning. The elements
that I just pulled from this sight were internally dated as 21 June 1996
01:00 UTC (actually 96173.0491276). These elements are currently a fairly
good match to the models that NASA posts on the WWW at:

        http://shuttle.nasa.gov/sts-78/demos

Also be aware that NASA may post more that one set of elements in the
`shuttle.html location. Look for the one with the latest internal date/time.

More than enough said.

FWIW,

de KC5RRZ (Doug)

785. Garmin 45 & PicoPacket

From: schiers@ames.net
Date: Fri, 21 Jun 96 10:50:44 -0500
To: aprssig@tapr.org
Cc: winaprs@tapr.org
Message-ID: <199606211553.KAA16979@tapr.org>
Rendered body type: text/plain

I have a Garmin 45 and just ordered a Pico Packet standard model for
mobiling about. I am not going to run APRS while mobile. I want to run in
a stand alone mode with just the pico, garmin and radio.

If anyone has done this with a setup similar to this, could you please
drop me some hints:

1. What data mode (i/o) should the Garmin 45 be in. Any special settings?

2. What commands should I use in my terminal software to initially set up
   the pico tnc?
e.g. gps commands, timed transmissions, etc.

Does data just automatically start flowing from the Garmin and the Pico
decodes it and sends it out at some specified interval?

At this point, I don't have a clue and I should have all the parts ready
to run by next Wednesday. TIA. 73,

hasan schiers, N0AN--

Yup. There's also a V.5.1 (which I've got) which also is
not GPS or APRS ready. But the upgrade chip (according to Kantroncis) is only about twenty or twenty-five bucks, which beats
spending $110+ for a new one!

```
Hi All,

     Well, I finally got the PacCom Pico-Packet with the
built-in GPS receiver.  Aside from the obvious (to most of us)
considerations for getting such a unit, I intend to use it in
various New York City ARES/RACES functions, such as parades,
marathons and the like.  I'm even going to try to get it into
the New York City Marathon (for which comms are NOT handled by
this group, but I'm Mile Captain for Mile 21 [where the race
leaves the Bronx, down to 122nd Street and Fifth Avenue] and I
think I know the right people to cajole about it.)

     Those of you who have operated this unit already could do
me a great service in rendering ANY advice or recommendations
you may have about it.  It'll (mostly) be used with a Yaesu
FT-530 H-T (mobile and portable) thus freeing the mobile rig
for voice comms.

     My vehicle (Nissan Pathfinder) has a glass sunroof which
has some kind of black grid on the inside of the glass to cut
down on harsh sunlight.  I suspect it's plastic, not metal.
Below this is a thumbscrew-on headliner, which gives me a bit
of space (1/2 to maybe 5/8 inch) between it and the glass.
Seems to me, if the antenna is short enough, this would be a
good place to put it, since I wouldn't have to route the cable
outside the vehicle, it'd keep it dry and (unless this plastic
grid is a problem) would be able to see the majority of the
sky.  BTW, I picked up a spare one of these sunroofs (rooves?)
from an abandoned Nissan Stanza a few years ago ... they're i-
dentical.

     Thanks for your responses.  Please respond direct unless
you think it'd be of general interest to the SIG.  73 de

Message-ID: <19960621174740831.AAA302@KAREN>
Rendered body type: text/plain

Hi, All!
I have watched the discussion on the Sig in reference to the Agrelo engineering DF Jr. and thought I would throw my 2 cents worth into the pot.
        I was/am one of the 10 beta testers receiving my unit several weeks prior to the first "production" run.
        When UPS dropped off the first package I sat down with the manual and was able to put the antenna system together without any difficulty. I hooked up the power cables and using a Standard 108C (mini-radio) went on the air. I had some difficulty getting unit calibrated. Not being much of a fox hunter I asked Dave, KA9NHL, to help with setup. Dave took the unit down to the Central Illinois Balloon Association group and they proceeded to run some tests. Being unable to get unit calibrated properly, they called Joe Agrelo direct about what the unit was doing. When I got the DF Jr. back from Dave and the CIBA folks, I called Agrelo and talked with Joe intending to see how I could go about getting my unit fixed. Joe told me that a new unit, coupler, and antenna system was on it's way to me already. And as a matter of fact, it arrived 15 minutes after I got off the phone with Joe. UPS Express delivery! I again assembled the antenna, hooked the unit up, and it worked as advertised. I am able to consistently get accurate LOPs displayed on both the box itself and on my trusty laptop screen. I will have a much more comprehensive review of the system after this weekend as we will be conducting a joint US Coast Guard Auxillary/US Naval Reserve evolution on Lake Michigan in which part of the radio gear put to use will be a DF Jr. (I can tell you right now that we (Dan N9XHP)were impressed enough with Beta units to order 10 additional DF Jrs. for the US Coast Guard Aux/Marine Safety use here on the Chicago lakefront.)
        In conclusion, I'd like to note that in today's mail I received a microprocessor upgrade for the DF Jr. including complete installation instructions and a phone number to call for advice if you get stuck. Compare that to the recent comments concerning a major GPS manufacturer's policy on firmware/software upgrades. Agrelo engineering is a class act!
Ed Rogers, N9LCI

The uP chip that you recieved was a result of a problem with the GPS interfacing. I noted it to them about 10 days ago. They promptly halted production, tested, got the same results and proceeded to upgrade every unit already out there. Joe told me yesterday that about 50 of those chips were sent out!

>    the pico tnc?
> e.g. gps commands, timed transmissions, etc.

The manual is pretty good on this...
A) LOC E 30 sets the Pico to transmit the LTEXT contents every 300 sec (5 min)
B) LPATH APRS v [digi1] [digi2]...
C) MTRANS ON (if it supports this) allows you to monitor while in transparent
   mode for things like DGPS
D) GPS ON

> Does data just automatically start flowing from the Garmin and the Pico
> decodes it and sends it out at some specified interval?

If GPS is on, it comes up in GPS mode when power's applied. Data that meets
the GPSTEXT mask will be placed in LTEXT and sent periodically.  I'd expect
teh Garmin to start up in the same mode as it was powered down from.

gerry

Unless things have changed recently, these were, indeed, propagated Keps,
based on propagated state vectors (the "propagated" part is significant).  You
might get caught occasionally with "what-if" maneuver vectors, rather than
analysis based vectors, thus leading to some transient errors.  HOWEVER, they
should be reasonable.  Unlike expendable launch vehicles, and their payloads
that may take several days to stabilize, the Shuttle is actively stabilized,
and anything posted after OMS-2 should represent a good vector, if it's
analysis-based.

The DEMOS system is a good comparison for you to use:  Based on analysis-based
vectors, it shows the attitude and subsatellite point. SGI systems can do some
neat things!
```

Date: Fri, 21 Jun 1996 20:02:03 -0500 (CDT)
To: aprssig@tapr.org (BBS SIG mailing)
Message-ID: <199606220102.UAA07358@tapr.org>
Rendered body type: text/plain

This seems to be a popular setting.

To get the APRS SIG in a daily digest mode -- send e-mail to
listserv@tapr.org and in the message enter

set aprssig digest

Then you will get a daily message -- which is easy to browse. Someone
recenetly posted a little script that takes the digest and breaks it back
out -- guess someone should snag that and put it in the ftp area with some
information.

Cheers - Greg, WD5IVD

Where can a person get the STS-78 elements, i downloaded all the ones
mentioned and didn't see STS-78 mentioned at all. Shouldn't it be listed
as such in the files?.

>
> 1. What data mode (i/o) should the Garmin 45 be in. Any special settings?
>

NONE/NMEA (That will give you no input and NMEA output; No need for the
           input)
NMEA 0183 2.0
4800 BAUD

> 2. What commands should I use in my terminal software to initially set up

```
>    the pico tnc?
> e.g. gps commands, timed transmissions, etc.
>
LOCation every/after N (N * 10 seconds)
        This determines how often the information in LTEXT is sent.
GPSTEXT $GPGGA (or use which NMEA sentence you would like)
LPATH GPS via WIDE (or whatever conventions you use locally)
        This is different than the unproto path.
GPS ON
        Turn this on after every thing else is set; It sets the RS-232
        port up for receiving GPS data.
```

Note: You do not need to worry about the GPSITEXT command, as it is only for sending information to a GPS if it needs it, which the Garmin doesn't need.

Once everything is set as above, the NMEA sentences starting with $GPGGA will be loaded into LTEXT. Then the information in LTEXT will be sent out over the radio at the specified interval with the LOCATION command. To get the tnc out of GPS mode, type a '\' with your terminal program.

> Does data just automatically start flowing from the Garmin and the Pico
> decodes it and sends it out at some specified interval?
>

Yes, once you have the I/O screen set up as above, the GPS will continually send the output while still operating as normal. Just make sure you have GPS output and the ground hooked up to the PicoPacket, and everything should work.

> At this point, I don't have a clue and I should have all the parts ready
> to run by next Wednesday. TIA. 73,
>

Well, I hope I have helped some. I have a Garmin 45 I am hooking up to the PicoPacket with the second serial port and battery. I haven't got my setup running yet, but I have read the manuals for the Garmin and Pico. Good luck with it and lots of fun.

coordinates for SLIDEL is 30,16.861N 90,46.660W
and at 64 miles or even 32 should include New Orleans. I have a smaller 8 mile map of that and it shows a lot of roads, water etc. Something wrong here. The map you send had only a couple of roads in it Hi. Try New Orleans it's coordinate is 30,3.950N 89,55.881W and see what you get. STRANGE are you getting this from a CD or from USGS internet files?.

>cdavidso@neocomm.net

The KPC 3 allows a remote sysop access to all of the KPC 3 commands. You can
change callsigns, txdelay, anything you want. Look for version 6 and above
for GPS capability though. I freqently play with these options with the local
machine..

The AEA unit will xmit it's location with the proper query text. Im not sure
about it's remote capability.
Im curious, has anyone used the MFJ unit that is supposed to be GPS
compatable yet. I remember one guy mentioned that they didnt work with GPS'S
at all...

The basic stamp that I have, which is now on the local WIDE-DIGI is set up to
respond to DTMF tones. With the right password, you can change poweroutput,
freq, channel. If I put another stamp on it I could have it respond to APRS
query... I decided that with the hurricane season here, it was better to be

able to adjust freq, etc than to respond to queries.

The more I play with the stamps the more I realize its time to leave them behind. They are neat, but the real power is in programming real computers. Seems like I need more and more power and only a real computer is adaquate. Thats where my efforts have taken me.

>KD4EMI@AOL.COM

It is interesting to be able to adjust frequencies but with the correct radio it is all buit in, power level frequency and split can all be done if nee be, still interesting to do on your own instead of via an "appliance". The only thing that I wonder is the part about changing frequencies is better due to hurricane season, why is this ? If one digi goes down (changes frequency) then whatever network there is and that people have learned to work with is HISTORY>>>>

If the digi is there on the premise that it is for APRS then it should stay on whatever frequency has been designated for APRS if not all the work that others have put in and the system they may need to rely on is gone.

Think of the problems that we had on 10.151 LSB a few months back. A few people are off frequency and others follow them, well if 2-3 people follow another handful of users that are off frequency soon the network is gone. One bunch is following the other while the other bunch is going the other way. Before you know it everyone is bouncing back and fourth trying to "round up" everyone else and in the meantime most of the communications links have been lost. I know what some will say, well it is necessary to be able to change in case someone else needs the services or if another digi is gone and we need to move off to where there is a digi that can fill the gap. Yes it can be a problem but a) if the digi is intended for APRS it should be, many other groups are depending on "that digi" (fill in the blank) that we have been using for months or years now. b) if another wide goes down we should do everything possible to get up a backup digi as soon as we can. We should be training for problems like this during field day. If a station goes down put it right back up with stored or borrowed equipment.

Another thing is if anyone is expecting the remaining digi sites that are on the air to allow APRS signals to come thru while they are sending 1000's of K's of data after a storm they will be surprised. We do not allow BBS's, forwarding, etc. etc. on WIDE digi's why should we expect them to let us use their already maxed out system for us to use? I do not blame them, they will have enough problems with the overload from other frequencies that have lost their sites.

The new firmware (v1.2.9 for 1270, 1274's, and v3.7 for 1278) does support GPS. It works sort of like the Kantronics, but not as detailed:

It will scan the serial port for up to two sentences as specified in the NMEAFLT1 and NMEAFLT2 paramaters, and TX the latest received sentence at the rate specified in the NMEABCN n command where "n" is the periodicity for the GPS packet in tens of seconds. Also, when NMEABCN is not zero, it will power up in GPS mode.

That's basically it.

Yes, you have a good point, however there are enough people on this list that
there may be several people that may need/want the information and have not
yet posted their question. Also while I think everybody that answered had the
same solution, it was answered in defferent ways so that different levels of
understanding might be successful. I think overall it depends on the request
for help, how general the question or answer is. If it is a relativly unique
situation then e-mail is most appropriate.

Another answer is for the person posing the question to post a summary of the
answers recieved into one message posted to the list. This would be a great
standard practice for the list and should satisfy most everybody.

73,

Bruce

Why don't some of those people that upload files to tapr include a
description text file. How the heck is anyone suppose to know what the
```

```
following files are. I know i'm going to get some smart Xss remarks, but
i bet that most of you don't know what these are. Gosh guys it only takes
another 5 seconds to upload a description.

MADTRAN.EXE
PRECEDUS.EXE
LOGSAT51.EXE (This one speaks for itself but still should have a
      description included)
VAVABCH.ZIP  (Now this is a real good one
VIWEST.ZIP

RE: the ability to change freqs on the digi.

Yes it's true it was a judgement call on my part.

I felt that in case of emergency , that we needed the site to be able to
switch freqs, and since there is only 3 or 4 people with mobile capability in
South florida and since there is really no PLANS with how to use aprs during
a hurricane and since it is in a perfect spot to digi 9 schools to the eoc
(during the last storm I couldnt connect to the EOC from ELY elementary,
Thank goodness that N4BP had his site up.   AND since NO other digi in South
florida (that I know of) has remote capability (freq, pwr, etc)

I just thought it might be helpfull.  Your points were well taken though.
Perhaps the remote digi control (via DTMF) lends to confusion. It might be
better to remove it for this season until more sites have that ability or
just forget the whole idea.  Sorry I even announced it.

Since we all use TNC'S here, Ive got an extra KAM that works
PERFECTLY !!!  IT has VERSION 5.0

The rig is in GREAT SHAPE  looks good works fine...

THE only thing is that it doesnt have a battery backup. It would not be good
for mobile ops.  Once you power down, you have to re-initialize everything.
It wont perm the settings cause I only switched the ROMS for the version and
didnt upgrade the eePROM.  If you need a perfect rig for the house , that you
dont mind leaving on (or just re-initializing) when you power down let me
know...the price is right.   If you spend 10 bucks and buy the upgrade eeprom
it would perm fine..  I need some other stuff and want to sell it...

$120.00 Shipped.
Please EMAIL me personally and not to the sig...
or contact me at 954-974-4153

I thought that this was what the SIG was for!  I realize I got
much duplication  of responces but a HAM in the ares is having the same
problem with his KPC-3 and got possible solutions from the responses to
my inquiry.
        Everyone seems to have missed the last sentence of my
indquiry.....once into the GPS Mode I CANNOT reconnect to the KPC-3 with
any of my packet programs!  I user Hostmaster II+ to set up the KPC-3
but Hostermaster now tells me I have no TNC connected to the comkputer.
PackTerm and PacketPet also respond the same way.
        If i ever get back into the KPC-3 I'll try the speed hints with
the control <c>'s!

Thanks Guys!!!!

Don't be sorry, I think it is a great idea for other applications. Take
users in a condo that cannot have a antenna. If a buddy within range is
willing to "store" some equipment for them at their home this is a way that
someone with a HT can have a good signal into the local networkS. Or even
someone with access to a good site, some people a lucky, they can set up a
personal remote base and control it from home.

If someone does not have a DTMF capeable rig but can get a stamp wired up
that would be great idea.

827. APRS and APRtrak

From: w5nfc@amsat.org (George D. "Zeke" Harvey)
Date: Sat, 22 Jun 1996 20:27:15 +0000
To: aprssig@tapr.org, Bob Bruninga <bruninga@nadn.navy.mil>,
 amsat-bb@amsat.org
Message-ID: <199606222027.PAA15413@mrzip.cc.utexas.edu>
Rendered body type: text/plain

```
I recently changed computers from a 386-25 to a Pentium 150.

I am running Win APRS on the new machine with no problem under Win-95.

With the launch of the latest shuttle I wanted to use APRtrak running under DOS
the same as before on the old machine.  After moving everything in the APRtrak
directory, including all sub-directorys, I find that the program is unable
to communicate with my TNC on Com-1.  The TNC is a DSP-12.

I have also moved all the files and directories associated with APRS75 and tried
to run it with the same results.  I am able to load everything including my
registration number, 19934, and everything comes up but am still not able to
communicate with the TNC.

After seeing your reference to beta version, APRS76E, I down loaded it and put
it into the APRS directory and when I execute this version and enter my call
etc. it comes up and says cannot find MAPS and locks up there.  Pressing the
enter key at this time sends me back to the DOS prompt.

Any suggestions would be appreciated.

73,

George D. "Zeke" Harvey - W5NFC - Austin, TX

A good deal of the value of the listserver disappears if this approach is
adopted. It is the ANSWERS to other peoples questions that cause me to
continue to read the list. Yes, every once in a while a question is so
specific and so easy to answer that we get ten responses, but that is what
a delete key is for. Again, let's not throw out the baby with the bath
water.

Public questions and private answers will severely limit the utility of
any listserver and I would encourage discretion in adopting Steve's
approach.

Ask yourself the question:

Will my answer inform an interest of "quite a few" people or just this
"one" person. If the former, then I would send it to the list, if the
latter, send it private. It ain't rocket science to determine what the
level of interest might be, e.g.,

Popular GPS receivers...high.
A surplus military gps from Fair Radio at 399 bucks....very low. TNC
related questions....high. (but may generate 20 replies if obvious) APRS
software questions...very high

All of the above, obviously, as they relate to APRS.

and...with my opinion and a quarter, you can still get a cup of coffee.

That is a special FCC "bone" sent out for GA stations. THey can use the KN96
prefix due to the Olympic games.

Don't know who it is either, I have sent that station 2 messages on 30M
about his signal. Got some terrible RF in his/her audio. I did manage to get
a ACK back today. RF was not as bad but ACK's are difficult due to the
distortion. If anyone knows this person please let them know, it is probably
a simple job to clean it up, many of us have had it on occasion.

You guys must not keep up with the latest bulletins.
It is a special form of callsign that people in GA can use to commerate the
Ol*mpics.
I don't yet know if we have to give ACOG the million bucks every time we use
it.  Mine would be N96NEQ instead of N4NEQ (in case I wanted to waste the
time to change it).  Most of the people who try them on voice here get
quickly laughed into changing it back.

I think you can use  N900LBG for yours.  Oh Boy!!

```
I posted my original quarry at about 8 AM.  By 4:30 that afternoon there were
a great many responses and the surprising thing was there was only one duplicate
site.

The following is what I received:

            WEB SITES FOR KEPS!

http://tbcnet.com/~jleonard/leonard.htm

ftp://archive.afit.af.mil/pub/space/tle.new

http://www.grove.net/~tkelso/

http://www.amsat.org/amsat/sarex/orbit.html

ftp://tbcnet.com/pub/jleonard

ftp://ftp.amsat.org/amsat/keps/sarex/STS-AMS.TXT

ftp://archive.afit.af.mil/pub/space/tle.new

http://tbcnet.com/~jleonard/leonard.htm

http://shuttle.nasa.gov/sts-78/orbit/orbiter/sighting/shuttle.html

DEMO

http://shuttle.nasa.gov/sts-78/demos

Thanks to all for the replys and I'm sure there were others
that found the information usefull.

Bud (WB4LTF)

control the way you interact with the computer. This architecture permits
Web pages and the browser itself to be highly customizable. These new
objects are small, since they don't require a traditional browser to run,
and nimble, so you'll see better overall performance when using your browser.
>
>Over time, more software applications will take advantage of ActiveX.
That's because ActiveX components are available to the entire operating
system, so you'll see more programs become Internet-savvy over the coming
months. Software developers can write one set of code for productivity
software--and easily snap in Internet features. Internet Explorer 3.0's
ActiveX core allows the browser to become a highly customizable and
programmable interface for the Internet, intranets, multimedia titles, and
your own work. Here are the parts of ActiveX you need to know about.
>
>ActiveX Controls: These are small programs embedded in Web pages, and they
can control other programs on your computer. The ActiveX version of OLE
controls are stripped down and more lightweight than previous incarnations
of Microsoft's OLE technologies.

Sorry if this is off topic, but I wanted to clear all this up...

(reprinted from The ARRL Letter, April 12, 1996)
FCC OKAYS OLYMPIC CALL SIGNS FOR HAMS OPERATING IN GEORGIA

Hams operating within the state of Georgia may use special call signs from
April 15 until August 31, 1996, to commemorate the 1996 Olympics, under a
Special Temporary Authority issued by the FCC. Here's how it works: An
FCC-licensed radio amateur operating in Georgia with a "4" in his or her
call sign may replace that number with "96" (representing the year) or "26"
(commemorating the 26th Olympiad) during the period of the STA. Hams with
any number in their call signs and operating within the State of Georgia may
add "00" to the existing number (to mark the centennial year of the Olympic
Games). So, WA4BKD in Georgia could identify as WA96BKD, WA26BKD or
WA400BKD, while NG3K, when operating in Georgia, could identify only as
NG300K or as NG3K. The Olympics start in July. The STA stemmed from an

```
initiative by James Altman, N4UCK, of Atlanta and the Georgia Amateur Radio
Operators Group he organized, with the support of ARRL.

I suspect it depends on the load.  Once again, the satellites are a resource.
We have no more right using APRS to "grab" all the resource than, say, the DX
Clusters or the tcp/ip folks.  If it's busy with other packet traffic, I say,
let it lie.  If it's freed up, hit it.  But don't monopolize it.

847. SAREX Keps

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Sun, 23 Jun 1996 08:44:16 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <199606231344.IAA18350@solar.cs.tamu.edu>
Rendered body type: text/plain

```
Just for the record, Gil Carman, WA5NOM, at NASA/JSC, is estimating the latest
Keps issue from him will be valid for up to 3 days.

For microgravity missions, it is common to seek a gravity gradient, free-drift
mode that minimizes use of attitude thrusters and other accelerations.  The
Orbiter is placed in an attitude that is inherently stable and subject to only
minimum amounts of drag.  So: If I don't post anything from Gil for a while,
don't panic, just keep working off the older Keps.  If you DO notice a real,
and large, variance between predicted and observed, let me know.  I will pass
it on and we can see if the anomoly is based on state vector changes, or
antenna occultation.  Which is the usual case...

And I still use a unix system and Elm.  I'd really appreciate the format
changing so that the Reply to: header points to the individual rather than the
group,  so that I can easily reply if is a question NOT likely to be of
general interest, or Group Reply if it is a question of more widespread
interest.

That you like one mailer over another is fine.  Please don't tell me I have to
conform to your preferences... life could get pretty boring without the
diversity.
```

Rendered body type: text/plain

```
OK, I had more time to clean up the PA maps, and tie in the detail maps
into a good overall system in the area of NW Harrisburg area.  This is
all posted in PAmaps04.zip.  Its in the tapr/SIG/aprssig/files/upload
directory on the tapr.org FTP site.  When u unzip this file into your
APRS directory, be sure to use the standard PKUNZIP -d.  And in APRS,
select the PA maps with the MAPS-CHANGE-PA command.

The PAmaps03.zip I left off the commas in the MAPLIST, so it was pretty
well hosed...

```
Well after 1 week the web site is finally taking shape. I have added quite a
few links, a page counter, and a new look to it. Thanks to everyone who
forwarded requests! It has been quite an expirience to learn HTML in such a
short time but a LOT of fun 4am mornings!

I plan to add some mapping functions (html that is) for links to various FTP
servers which have the most recent editions of APRS or APRS related
software, and a seperate GPS .html page so everyone can go to where they
need to without paging thru other material. Changes are being made
constantly, ask my wife! and stay tuned for some pictures on the site. I
hope to get a flatbed scanner in 1-2 months (knowing me less).

I use PINE here on a linux system. When responding to a message, I am
asked whether or not I wish to use the Reply To: header instead of the
From: header and whether I wish to reply to all recipients or not. You
might want to give that a try if it is available on your system.

Actually, Since I am 'the other ham' in N5TAM's area, I was really looking forward
to an answer posted on the sig, plus to see if we are having a unique problem.
Once the KPC-3 is put into GPS mode, I have a difficult time getting it back
out to terminal mode.  My problem is just slightly different from Roy's in that
my terminal software, PROCOMM, does recognize the TNC but cannot convince it to
```

switch out of GPS mode. The responses on the sig to date led me to try different rates of entry, long pauses, no pauses, etc... but the thing STILL won't switch back! The other responses that suggested remote access are very welcome as I hadn't thought of that before, but the bottom line remains 'Is there ANOTHER way to get a KPC-3 out of GPS mode?' E-Mail to Kantronics has failed to elicit a response.

So, don't berate the many responders to seemingly simple questions. Not all of us are at the same level of APRS knowhow as you.

Just for the record, I'm using the HyperTerminal program that comes with Win95. It usually takes several tries of shutting the TNC off and doing the CTRL-C 3X sequence to get out of GPS mode, but persistence DOES pay off!

Sam- I'm sure most readers allow you to change fields when replying to a message. Mine does. But that was not the issue. The issue was just to add a safeguard to keep folks from accidentally sending replies to the SIG when they meant them to be private. A nice change would be for the field to be blank. I don't even know if it *can* be changed on the remailer end. I only know the question has been asked at least a dozen times and never yet has anyone who is an administrator (of Host) of this list given an answer.

But thanks for the info on Pegasus. Our Company dropped it a year ago when we proved it wouldn't work with Trumpet's Winsock.

```
One day when you accidentally reply to the SIG when you didn't mean to,
we'll try to refrain from smirking    ;-)

The list server adds a "Reply-To" field to the message.  Some mailers (like
pine) give you a choice to reply to the "From" or "Reply-To" addresses.  Others
(like Netscape mail) don't.
```

Personally, I'd like to see both the list address and the sender address appear in the Reply-To: field. Most of the other lists I'm on do that. That way, if you are directly responding to a question, they get their answer directly, as well as through the (slower) mailing list. If you want to reply only to the sender, you can delete the list address.

Personally, I think that the volume of this list would go down by half if the list address is not the default reply address. Aside from not getting the direct replies (which others silently benefit from), others are less likely to put their two cents in when it "costs three cents" (the effort of typing in the list address).

861. More Blackjack Antennas Now Available!

From: ku0g@sprynet.com
Date: Sun, 23 Jun 1996 22:07:07 -0700
To: aprssig@tapr.org
Message-ID: <199606240507.WAA16633@m1.sprynet.com>
Rendered body type: text/plain

Hi, GPS Users! I've just gotten the parts together for another run of the Blackjack GPS Patch Antenna! Out of this run of 50 antennas I will produce 25 Blackjacks, 20 Naturals (weatherproofed version) and 5 amplified test antennas.

I have just finished putting a dozen single-port mode switches together tonight! The price for these units is $15.00 plus $5.00 shipping/handling!

Get you reservations in now! First come, first served!!!

Terms, as always, are:

MONEY ORDER made payable to James Duncan. Note: We do NOT accept personal checks! Please don't send them!!! In the near future we will begin taking Mastercard/Visa, but not until Karla and I can afford the setup fees for a credit card processing account!

Due to a slight error in estimating shipping charges, I am increasing the shipping/handling charge to $5.00 which makes the total for the Blackjack to be $44.00. The Natural will sell for $49.00 plus $5.00 shipping/handling.

Mail Order/Payment along with shipping address to:

BLACKJACK
13 N.W. Barry Road, #141
Kansas City, MO 64155

I enjoy hearing from those who have purchased the Blackjack Antenna! Please send a note about your use and the performance of the antenna in your setup!!!

More importantly, ask is this a simple question someone is not able to find the answer to. This happens to everyone from time to time, and it is OK to ask these questions. The problem is when 20 people all post the answer, and each post is mailed out to a couple hundred people, it wastes a lot of bandwidth, and a lot of time deleting messages from the mailbox. even if most people don't pay by the byte anymore, their time is still valuable.

But they won't remember it when they need it. Is it really worth
literally thousands of email messages to answer a question that is in the
docs? I want to stress, I have no problem with the question being posted,
but I think people need to stop and think about whether everyone in the
sig needs to know the answer!

I understand the many folks who want for someone or something to keep
them safe from harming themselves.   I was taught to be responsible
for my actions so I take responsiblity for myself..  I don't need
the Listserver to hold my hand.

It would be okay to send the mail to both the list and the person..
So if it is a flame ( God forbid )  or some other thing it could be handled by
editing out the sig address and leaving in the personal address.
I also understand the business of pressing the wrong button and
sending the "private" message to the whole sig. I have done
that . .!  Wow..  I was embarrased. BUT did learn something from it.

BUT I do see a value in the whole sig seeing most return messages..
It leaves a big whole in the "conversation" when listening in, so to
speak. . .  I think FLAMES should be returned to the address posting
the flames and NOT to the whole sig.  I see alot of not too
constructive critism floating around on here.  I answer all my Flames
privately, right Gerry?

I do a whole lot of reading and very little posting on the Sig.  I
enjoy the "forum" style of the List rather than answering the
question in private.  I have learned much more listening than by
talking in my life.  This SIG is no execption.

Now lets end the Thread and talk about APRS!!!!!

866. KPC out of GPS Mode

From: "Mike Walker" <mwalker@interlog.com>
Date: Mon, 24 Jun 96 08:16:42 -0400
To: "APRSSIG" <aprssig@tapr.org>
Message-ID: <199606241217.IAA18750@gold.interlog.com>
Rendered body type: text/plain

You can exit GPS mode with your KPC using 2 methods.

One, set up the remote control feature (MYREMOTE and RTEXT commands) and
connect to the unit remotely and send the command INTF TERM.

The other method is to hook up the TNC to your computer at 4800 baud and send
the following stream   Q . (You can cut this to a file and send it to your
TNC with a modem program, or hold down the ALT key and hit 192 on your
keyboard (make sure numlock is on and use the Num Keypad). The ALT-192 will
produce the   character.

See page 83 of the KPC-3 manual (Kantronics Host Mode Operation).

I have included the above character stream in the INITTAPR.TNC file so when I
take the TNC from standalone and hook it up to the laptop, it automatically
takes the TNC out of GPS mode. Make sure you also reset your BLT commands to
0, or you will be sending Posits at the rate you hand programmed.

regards...mike

869. APRS WX station request

From: "John B. Leonard, Jr" <jleonard@tbcnet.com>
Date: Mon, 24 Jun 1996 08:28:29 -0500
To: aprssig@tapr.org
Message-ID: <199606241328.IAA23730@tbc1.tbcnet.com>
Rendered body type: text/plain

A comment from someone during the Field Day:

He likes to turn to the APRS freq to see what my U-II is reporting for WX conditions. Once he was able to figure out what the xxx/xx/xxT/xxR/xxxP stood for, it made sense to him.

He did comment on what appeared to him to be a very wide discrepancy from one report to another; for example, a report that said that the wind was 300 deg/04 mph, temp 34, rain .05 in, then suddenly the report is 080/15/T86,etc.

I explained that the program stores the last WX report it got, and xmitted it until the U-II sent the APRS a current wx report. At least I thinks that's how it works.

Hey, Bob, APR. He asked, and I agreed with him, if the DOSAPRS could suspend wx reports on start-up until it gets fresh U-II info. That way only current wx reports would be xmitted.

ps: I haven't heard much about WinAPRS lately. It's been over a month since Dayton. Is that a dead issue now?

anyhow, thanks, Bob, for making a version that works. I was able to run it
on a Gridpad over FD (no, it wasn't my first choice for computers, either,
but that's all I had, without lugging the Pentium desktop out there. And,
no, guys, I WON'T get a Mac just for APRS), got credit for packet, was able
to get several QSO's, and demonstrate it, and the WX stations, to several
people, one of which a Northern IL Univ student in the Meteorology program
there, that didn't know that capability existed.

Subject: [APRSSIG:2333] Re: Email Overload revisited

I do a whole lot of reading and very little posting on the Sig. I enjoy the "forum" style of the List rather than answering the question in private. I have learned much more listening than by talking in my life. This SIG is no execption.

Now lets end the Thread and talk about APRS!!!!!

Well said!!

P.S. I'm using Exchange for this reply. If anyone see's that nasty attachment stuff let me know by emailing me and not the SIG so I can try to figure out why it does that all by it's self.

   aprssig@tapr.org said:

>I hope some can appreciate the irony of the amount of email generated,
>several posts coming from a single person, on the subject of "Re: email
>overload",

It happens every time an issue is raised...the mail to discuss the mail
exceeds the original topic by an order of magnitude.

It should also be noted that "email overload" as far as I am concerned is
a theoretical construct. I have never experienced a "crawling" of the
network as a result of mail on a specific topic...it is cumulative, of
course, but  excruciatingly difficult to pinpoint.

A modicum of restraint and judicious use of the delete key will suffice.
SPAM far outweighs the impact of "too many answers", casual discussion,
off topic discussion or "discussions of discussion".

It kinda works like this:

1. A simple question gets asked and a bunch of answers are offered, all
with
   the same advice.
2. Someone complains about the multiple answers or barks about RTFM. 3.
Several others join in pro and con.
4. Several others lament the joining in pro and con.
5. Someone says, let's drop this thread.
6. Several others agree and add their personal assessment of the
problem/solution. 7. Everyone eventually gets bored with items 1-6 above
and the thread dies.

I doubt if this process will change much, so my delete key keeps pretty
busy, but I don't bother to complain, as it's too much like teaching a pig
to sing. (Don't be offended if you don't know the joke...if you do, you
won't be offended.)

Hi Folks

Any progress on another update of winAPRS? Seems a long time since any
changes were made. Plenty of bugs to fix!

BTW I am using it virtually 24 hrs now as GATE into Long Island area.
Generally it only crashes when you close/open map windows, if you don't
touch it it seems pretty stable. Anoying to have all those callsigns
changing by themselves though!

I'm using Exchange for this reply. If anyone see's that nasty attachment
stuff let me know by emailing me and not the SIG so I can try to figure out
why it does that all by it's self.

======================

David, I use MS Exchange too.  There is a problem with using the Reply
feature.  The source of the problem is really with the APRSSIG remailer not
understanding what to do with RTF characters and converting them to
attachments.  You'll notice there will be no problem if you reply to
someone who sends you direct email, but if you reply to the APRSSIG people
will flame you bigtime!

The solution that works for me is to use the Forward button instead of the
Reply button.  This is only necessary on some SIGs.  You'll have to
manually re-enter the SIG address (aprssig@tapr.org), but at least it
works.

I want to thank everyone on the sig for answering my plea for making a 32
or 64 mile map for some potentional new PARS users around the New Orleans
area. I got exactly 1 offer and that person did attempt to make me one
but had problems with it, so in summing up i didn't get one!. It look
like sig users are to busy posting those silly requests for changes in
the format, or who should answer who and in what way, Sound like a bunch
of little kids that are fighting over what color marbles to use. Then
there are those that critizise me for what i post, wake up guys.

Anyway i have posted those map files on tapr for Jan WB5TKC, but anyone
else that wants them they are there as WB5TKC.ZIP & WB5TKC.TXT. I don't
leave the stuff there to long so get them now. I erase my files as not to
clutter up tapr. Go ahead guys send the flames, but do it in private
e-mail please.

The listserver does not attach anything. The attachment is made by the original mailer, M$ Exchange.

The source of the problem is that Exchange sends them in the first place. Somewhere, buried deep in some menu, is a button that selects if the RTF version will be sent or not. Since Exchange is meant to be used as a workgroup mail program, not an internet mailer program, this defaults to "on", so the visual fruit salad of mixed fonts, underlines, italics, and what all else is not lost when sending it to your co-worker across the hall.

The unfortunate side effect is that the messages that are sent are about three times the length that they need to be.

(Personally, I think that it's a M$ plot to simply annoy the hell out of everyone that uses a competitor's product.)

Hello all;

In the Florida EPAN (East Panhandle) ARES APRS net, I have the responsibility of posting all tropical cyclone tracking data. I download the latest info from the NWS over the internet and manually input the position, course, speed and time of report.

I have found that not only will WinAPRS not dead reckon, it also screws up the DosAPRS stations dead reckoning, by updating the time at every transmission of the position data.

I don't see anything about dead reckoning tracking in the docs for WinAPRS. Can anyone tell me how to work around this?

regards,
Joe KF4DYS

886. Cleanup of upload area

From: lmkeeran@rs6000.cmp.ilstu.edu (Larry Keeran)
Date: Mon, 24 Jun 1996 16:44:31 -0500
To: aprssig@tapr.org
Message-ID: <v02120d06adf4aee28f30@[138.87.2.109]>
Rendered body type: text/plain

The TAPR upload area for APRS files is continuously undergoing a cleanup. The upload area is a nice central point to find the most recent files. Then, they have to be "filed" in the correct place. I have volunteered to keep track of what goes where and redirect the upload files into the correct subdirectories after they have been in the upload directory a while.

Backround-

The TAPR WWW site will have the descriptions of each file (sort of like: ftp://ftp.tapr.org/tapr/software_lib/00-index.txt) and then you will click on the filename to download it. This requires a description of the file that you upload. I may not understand what the file does so it is best that whoever uploads a file include a text file with the same name describing the particulars of that upload. Include the decompressing details (such as; Please pkunzip to a directory called ABCDEFG using the -d switch) (or This is a self extracting Macintosh file that requires AppleEvents) in the description.

also see: ftp://ftp.tapr.org/tapr/software_lib/UPLOAD/readme

I am recommending the following files be moved to the directory name that is after the file name:

```
 mv MOWINMAP.ZIP /files/maps/WinMacMaps/
 mv NEBDYS2M.MAP /files/maps/PCMaps/
 mv SDBDYS2M.MAP /files/maps/PCMaps/
 mv TNMAPS04.ZIP /files/maps/PCMaps/
 mv autwx63.zip  /files/dosstuff/
 mv dlgview2.txt /files/dosstuff/
 mv dlgview2.zip /files/dosstuff/
 mv ilmadco.zip  /files/maps/PCMaps
 mv logsat51.exe /files/dosstuff/
 mv madtran.exe  /files/dosstuff/
 mv mdmaps06.zip /files/maps/PCMaps/
 mv nemaps01.zip /files/maps/PCMaps/
 mv nw_gps.bin   /files/dosstuff/
 mv ohmaps07.zip /files/maps/PCMaps/
 mv pamaps04.zip /files/maps/PCMaps/
 mv precedus.exe /files/dosstuff/
 mv tnnewmap.zip /files/maps/PCMaps/
 mv wiwest.zip   /files/maps/PCMaps
```

If anyone knows the contents of each of those files, could you upload a text file with the same name but ending with .txt? Let me know soon if you want them to be put in a different subdirectory.

The following file is to be removed. A readme.txt in this directory should talk about upload related information. I believe it also is in the correct directory besides this one.

```
 rm readme.txt
```

```

I am replying to this message using MS Exchange. I suspect it will have an attachment.

I've checked the Rich Text and MIME boxes off (many times) and there are only attachments when I reply to a message, not when I originate one.

I even downloaded "Preventing WINMAIL.DAT sent to Internet Users" and "Preventing Winmail.dat from being sent over IMC from the MS Knowledge Base (accessed via the MS web site). Both those documents say to turn RTF and MIME off, but it seems that isn't enough.....

I've downloaded Eudora and will use it as soon as I figure out how to move my multiple megabytes of saved messages out of Exchange where I can access them.

I'd really like to use Exchange if only some bright soul could provide the magic menu instructions.

Gwyn

Message-ID: <v02140b01adf4d4908ec3@[199.0.52.85]>
Rendered body type: text/plain

Can someone send me the details of making a map by hand for (Mac/DOS)APRS?

We are having an even this weekend, and I'd like to make a little map. I was thinking I'd drive the course and flag all the major points (ie checkpoints) as well as any major turns and then make a little map. Shouldn't need more then a hundred points tops for a rudimentary map. Being able to put labels in would be a boon (ie for checkpoints and intersections).

Thanks,

```

not
> understanding what to do with RTF characters and converting them to
> attachments.

The listserver does not attach anything. The attachment is made by the
original
mailer, M$ Exchange.

Then why is there no attachment if you send me email and I reply to you?

The source of the problem is that Exchange sends them in the first place.
Somewhere, buried deep in some menu, is a button that selects if the RTF
version
will be sent or not

Okay, I followed the expert advice and turned off MIME encoding in my Tools
> Services > Internet Mail > Message Format. Let's see if it works...

Sorry to have wasted yet more bandwidth!

Larry

Except that most replies will be intended for the whole group ... hence
the desire to have that the "reply-to" location.  More sophisticated
email software allows you to choose between the two or even send to both.
On the other hand Windows and Mac users can cut and paste the address
from the original.

I second the need for making the senders address the automatic reply
address, rather than APRSSIG.

Paul's guess at 50 % reduction is realistic. I have seen it reduced on
other ListServers. You don't loose quality, but the quanity of useless
postings that attribute nothing to the SIG.

>

You did something wrong then. We heard them in the Keys abt 3PM. We heard them calling for contacts, but did not respond to anyone. Since there were several thousand people listening for them, I'd guess either the QRM was too great to hear anyone or (more likely) they had something set incorrectly. We tried all 5 uplinks and even simplex with no joy.

898. Looking for maps for trip from Austin, Texas to Kingston, Ontario

From: Lansing Pugh <lansing@acadlp.com>
Date: Mon, 24 Jun 1996 23:01:28 -0500
To: aprssig@tapr.org
Message-ID: <31CF6498.2759@acadlp.com>
Rendered body type: text/plain

Hi APRS folks.

I'm traveling with family from Austin, Texas to Kington, Ontario, leaving this Wednesday morning. My plans for gathering up the necessary DOS APRS maps got messed up with all the fun I had on Field Day. Our itinerary looks like this:

```
                                                                  Kingston
                                                        Toronto
                                              Lansing

                                         Fort Wayne

                                   Indianapolis
                          Terre Haute
                  Effingham

                 Mt. Vernon

                 Carbondale

                   Cairo
             Sikeston

             Memphis
                                      +--------------------------------+

       Little Rock                    | Not for Navigational Purposes! |
                                      |             <g>                |
    Texarkana                         +--------------------------------+

Dallas

Waco
Temple

Austin
```

If you have any good maps that cover this route that you can send me (lansing@acadlp.com), I'd be most appreciative. Ditto on maplists.

A cursory inspection revealed I could use at least the following maps I've had trouble finding on the tapr ftp site:
IAILINMO.map
NYstate.map
NYNORTH.MAP
Montreal.map
ARLRock.map
TXDallas.map

Anyway, I hope to see your beacons along the route to keep me awake!

Thanks!

Lansing, KK5VK

899. TAPR 1.1.9 Firmware has GPS

From: schiers@ames.net
Date: Tue, 25 Jun 96 06:44:39 -0500
To: aprssig@tapr.org
Message-ID: <199606251147.GAA13584@tapr.org>
Rendered body type: text/plain

I got strictly negative replies regarding GPS support in TAPR's TNC2 firmware when I posted the question a week or two ago.

As it turns out, there is NMEA support in ver 1.1.9 which is what they are selling as of now, at least. I haven't tried it yet...but the addendum to the manual clearly has several commands that specifically address using the tnc in stand alone gps tracking mode, with examples.

The proms are 15 bucks from TAPR. 73,

hasan schiers, N0AN--

900. Exiting TAPR GPS mode?

From: schiers@ames.net
Date: Tue, 25 Jun 96 07:26:22 -0500
To: aprssig@tapr.org
Message-ID: <199606251227.HAA15039@tapr.org>
Rendered body type: text/plain

Now that I have discovered that the 1.1.9 firmware has NMEA support for stand alone tracking (at least it sure looks like it), could someone tell me how to exit that mode once entered? The manual addendum is about as clear as mud. 73,

hasan schiers, N0AN--

So far, no one has reported hearing SAREX packets. A few voice contacts have beeen confirmed. If you havent activated APRtrak yet, you haven't missed anything. So with 10 days or so to go, there is still lots of opportunity. Just bring up APRtrak and put it in SPACE mode to automatically plot the position of other APRtrak stations who successfully get a packet into W5RRR-1. The following logs what we have heard on the USA east coast and via Internet.

```
DAY EDT   ZULU  COMMENTS
--------  ----- -------------

Do they have the 1.1.9 ROM image anywhere? Last I looked, the latest they had was the 1.1.8 ROMs for download.

With EPROMs and a burner available, I don't really care to pay the $15.
(Which probably barely covers expenses at TAPR.)

APRSdos REPLY COMMENT: You are not clear.

1) if its a stand-alone-tracker, then you put the {k} in the TNC Btext

2) If you are running APRS in the truck, then use the INPUT-MY command to tell APRS what symbol to use.

Do not use APRS to configure a stand-alone-tracker unless you use the OCT mode and disconnnect the TNC before exiting the OCT screen. Otherwise APRS will change several of the TNC commands that you just set up!

909. MicroSloth Ex-Change

From: barrettd@crpl.cedar-rapids.lib.ia.us (David Barrett)
Date: Tue, 25 Jun 1996 13:01:04 -0500
To: aprssig@tapr.org
Message-ID: <199606251800.NAA27319@tapr.org>
Rendered body type: text/plain

First off thanks to everyone that responded; based on the variety of mailers everyone uses I found out a few items I will share, none of which includes a solution as of yet, but did garner a few sentences on my bug report sheet to Microsoft.

First off; what is being attached to the email is format data for exchange. When I reply to a message my reply is in a color different from the main message, that data get's sent in the winmail.dat attachment along with font selections, the to from header font format and other things that would only be of interest to other users of exchange. Yep you guessed it! Everyone else get's a bunch of crap.

Turning MIME off in the exchange setting only makes matters worse; the dat file then gets sent as uuencoded and puts it at the end of the email. Yep you guessed it! Now everybody get's a bunch of crap.

```
        There is no other option. Paul Christenson had the best reply, and I
quote;"(Personally, I think that it's a M$ plot to simply annoy the hell out
of everyone that uses a competitor's product.)." It appears that the
solution for now is NOT USE EXCHANGE; I see no way to shut off the use of
RTF (rich text format)
in Exchange; none whatsoever, so I'm writting a little nastygram in my bug
report and sending it off to gatesland.
        My apologies to all for the garbage and my thanks for the feedback;
and to those others using exchange, I loved your RTF it looked like internal
mail here in the office, send me a spreadsheet or a picture file sometime
(directly to me of course)
        Tounge in cheek as always and embarrased into using Eudora again......

This is an unconfirmed, unofficial report:

A station on the west coast chatted with the crew on voice and they
indicated they would set up the PACKET SAREX "this evening". but also
that they enjoyed working voice over the US.

Maybe we will be lucky and hear some packets tomorrow (the 26th.)

In the meantime, non-US stations may soon see some packet activity.

Hello All,

Is there anyone out there who is a member of SKYWARN  that could get in
touch with me at my e-mail address and not the sig, I would appreciate it.
What I would like to know is how things are going with the use of APRS and
WINAPRS for early warning and storm movement and the NWS..

I would like to make the use of APRS and WINAPRS available up here with our
CANWARN group and our weather service ENVIRONMENT CANADA as we are tied
directly to them. I need to know how you are setting up the program with NWS
and how you are approaching them if at all.

I certainly would like to hear from anyone involved and maybe we could throw
some ideas around...

Thanks in advance.....................73

Your error was putting the {k} in the Beacon of APRS!  You put that into the
TNC's BTEXT as the first 3 characters.  That's intended for stand-alone
trackers!

>                              ROBERT MARLEY

Hello Robert,

3 things to try.

1. run MSD.com from dos prompt, type "c" or click on com Ports.
2. from win95
   a. control panel
   b. modems
   c. properties
   d. connections
   e. port settings
   f. un-check "use FIFO buffers"

3. Registry editor
   a. My Computer
   b. (c) or drive where win95 is
   c. Win95 or whatever u call it
   d. find Regedit and run it
   c. optional - drag it to make a short cut
next
   HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Class\Modem

warning: u will now hve total control of all windows settings
so be careful or don't be careful.

Hi and i seen the following on my map last night..

N0INX
N0BKB-1 AND -3
N0GGU-1
N0ZKK
KU0G-15 AND -8
KB0LRA
NV0O-15 GPS
N9PPJ-2
WB0QJB
N9LBG WX

922. APRS

From: William Nolle <ke4eer@worldnet.att.net>
Date: Wed, 26 Jun 1996 05:34:04 -0700
To: aprssig@tapr.org
Message-ID: <31D12E3C.79A9@worldnet.att.net>
Rendered body type: text/plain

Again there must be a band opening on VHF. Seen and acked a message to
N9SZI in IL that's a 323 mile trip. Also so far seen:

KB0OAA
NN9LBG
N0BKB WX
N9PPJ-2
N0BKB WX

That's with my beams pointing NNW.

By the way are there any advantages to setting prime digi's to
WIDE,WIDE,WIDE. I have seen a lot of that lately here in the South East.

930. DFjr Question?

From: Joseph Agrelo <jagrelo@cris.com>
Date: Wed, 26 Jun 1996 10:51:15 -0700
To: aprssig@tapr.org
Message-ID: <31D17893.7E60@concentric.net>
Rendered body type: text/plain

Has anyone out there connected their GPS to the DFjr using the Multi-Port Adapter (MPA) and noticed any garbled data in the beggining of the NMEA $GPSRMC data stream, specifically the time portion right after the $GPRMC(garble)?

We have *one* customer having such a problem. It would be much appreciated if someone else could check it out, we can't seem to reproduce the problem here, thus unable to fix it.

> So, we should set our UNPROTO to W5RRR-1 ? Not W5RRR ?

APRSdos REPLY COMMENT: I think so, but when they turn on the digipeater, we weill know for sure as soon as we start seeing packets.

NOTE TO EVERYONE: When APRS is in the SPACE mode, it is supposed to reset your BEACON timer to minimum (from the decayed value of 15 minutes) as soon as it hears the spacecraft, to improve your chances of getting a packet through. Note that it must hear packets *FROM* the W5RRR (-1) callsign and not just hear digipeated packets. SO dont get excited that APRS did not reset your BEACON timer on the first few packets. As soon as APRS sees one of the SAREX QSL or QRZ or any BEACON packet from W5RRR

```
(-1), then it will reset the BEACON timer.

```
This might not be the right forum for this question, but I'll ask anyway!

Does anyone know how to do the following with JNOS 1.10m?

1. Print a message in the mailbox?

2. Set the timestamp to properly report timezone?

Thanks to all for your help.....73s de KG6XT

Will be doing that real soon Joe, as soon as the DFjr arrives. Any
special instructions as to setting this thing up using the MPA. Can i
check that out using a terminal program instead of APRS?.

APRSdos REPLY COMMENT: See README\HF.txt

Your dual port will only transmit on one port at a time, therefore you
will only show up on one band, not the other.  THis is because APRS will
send your POSIT via the active port only.

SOLUTION:

1)  Set CONTROLS-BANDS-2PORT.  But now APRS will send the same posit via
BOTH ports. Now you will be seen on both bands, but it will be the same
posit an ssymbol

2)  But your TNC will BEACON the TNC BText to both ports automatically.
APRS naturally sets BEACON EVREY to 0 so that your TNC will NOT beacon by
itself while APRS is running, since you want the APRS BText to be
transmitted rahter than the TNC.

SO, STANDARD OPERATING PRACTICE for ALL GATEWAYS, is to manually pur the
command BEACON EVERY 0/10 in your INITTAPR.TNC file so that the VHF port
will beacon the TNC BText which has a POSIT report and uses one symbol,
and the HF port will NOT beacon (so that APRS can).  All of this assumes
you nomrally leave your TNC on HF.   Reverse the commands to 10/0 if
you opearate a Gateway but leave APRS on the VHF side...

936. First APRS packet via SAREX!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 26 Jun 1996 16:29:19 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960626160101.15699C-100000@arctic>
Rendered body type: text/plain

```
Following copied on AMSAT BBS:

---------- Forwarded message ----------
From: Bruce Paige <paigecom@alpha1.phoenix.net>

i had a connection this morning with the packet robot. also, there was an
aprs transmission---

XXXXXX>APRS via *W5RRR-1 [27/JUN/96 08:08:30]: <UI>:{F0}
W5RRR-1  :Hello STS-78 Frm XXXXXXX{1

--------------- end of forwarded message --------------

Congratulations to XXXXX for the first APRS packet!  (I decided to delete
his callsign since he gets enough grief already, hi hi)

But, it was not an APRS position report which is the whole objective.
It was an APRS message, which the SAREX robot has no way of handling.
SAREX is only acting as a digipeater in space.  It does not understand
APRS formats at all.

It would be best if we kept to APRS POSITS only (BEACONS if you are in
SPACE MODE) for several reasons.  Position reporting of ground
stations is our objective, message packets only waste air time, and
finally seeing message text between stations may encourage non APRS
stations to try DIGIPEATING standard packet via SAREX and then the cat
is out of the bag.  Everyone will try to connect to their buddy via
W5RRR-1 using standard packet and no one will get through.

Then they will turn digipeating off and the game is over....

PLEASE, no APRS messages TO SAREX or VIA SAREX!  You will never get an
ack to either one!  ALso make your alt-BEACON very short so that it
doesnt look like a long brag packet.  Our point is how SHORT an APRS
SPACE MODE PACKET (Grid square) can be...
```

937. APRS Sarex score card (3)

SAREX PACKET has been heard at 1130z on Wed 26 June.  Due to intermod, my
APRtrak only captured one packet and it was a standard CONNECT But I
could hear the Robot working packets like crazy!  Cant wait to see the
next pass after I install my intermod filter!

     The Shuttle Columbia callsign is W5RRR-1.  The following
logs what we  have heard on the USA east coast and via Internet.

DAY EDT   ZULU  COMMENTS
--------  ----- -------------
21  1745  2145z Voice KO4HD Fl Keys
21        2238z Voice Guiccone San DIego, and W5GEL Texas
22  0915  1315z through 1400 on 23 June nothing heard on 9 passes
23  1535  1935z voice heard in S. Fla
23        2110z Voice heard in Calif
24  0740  1140z nothing heard on next 4 passes
24  1355  1755z voice reported in Texas           END FIELD DAT
24  1530  1930z nothing heard on next 3 passes
25  1045  1445z I missed the pass
25  1230  1620z Voice over usa.  THey said Packet soon!
25  1400  1750z Voice over USA
26  0730  1130z Packet reported fm Alabama
26  0904  1304z Packet reported in Houston & East coast
26  1350  1750z packets! (But I had pager Intermod!!)

Remember, in SPACE mode, the GRID SQUARE POSIT is inserted in your
BEACON.  Do not send any APRS packets except your BEACON.  Use the
XMIT-BEACON command.  Do not send APRS messages!

Later when things calm down, sending your POSIT might be OK,  but that is
a much longer packet and is not needed if you send a SPACE MODE BEACON.
The SPACE MODE BEACON will put you on the map (using the gridsquare format)

938. MacAPRS v2.5

From: quarry@q.continuum.net (Chip)
Date: Wed, 26 Jun 1996 16:50:15 -0400
To: aprssig@tapr.org
Message-ID: <v02140b05adf751d0486e@[199.0.52.87]>
Rendered body type: text/plain

```
I'm sure it must be just me, but in spite of the fact that it has been
asked for here and responses made I have still been unable to find it.
When the question was asked, the response was that it was already (past
tense at the initial response) at both TAPR and Rutgers sites.  When I
first saw v2.5 on the air, when that response was received by me, and
twice since that response, I tried on both Rutgers and TAPR (the MacAPRS,
MacMisc, and Upload directories as well as random others) without
success.  I felt that perhaps it just needed time to become "available".

Can someone please straighten me out, is it just me (ie I'm blind) or is
this file not there?  I have no great need for the file (hence the
willing-ness to wait so long), but I am starting to get just a wee bit
frustrated that I'm told it's there but I can't find it.

*** I want it to be clear that I am in no way intending to flame or put
pressure on anyone (again I say I have no immediate need for the file), I
am just trying to get clarification for things said here. ***

> check that out using a terminal program instead of APRS?.

Hey Bill!

Since the GPS data is routed through the MPA to the DFjr,
a few things need to be configured first.

1)GPS port is turned on (MENU-3)
2)the desired POSIT rate is set (MENU-8)
3)set desired baud rate (MENU-5, default 4800)
4)baud rate to PC (MENU-4).

APRS needs to be configured as well, see APRS/README/DF.TXT, I think!

This is only a one time set up since the DFjr has an internal EEPROM.
Yes, data can be viewed through any terminal program.

Did anybody copy my posit packets via W5RRR-1 around 1620 Z Wednesday?

Here is what happened:

1) I transmitted my posit.

2) My computer crashed immediately thereafter.

3) Next, I copied a packet aurally on 145.55 but due to the crash, was
unable to decode it.

This one day after my 2-meter amp bit the dust. (Murphy go home!)

Thanks in advance!

Stan, WA1LOU

Hi APRSSIG Gang....I guess I am the only one in the whole
 world that is having trouble getting my GPS-20 receiver going.

        I have left it run with various ant. including the Trimble
 from PacComm to a small hunk of wire for over a hr. Some of the data
 changes but it is always 4 min. slow. And it does not seam to give
 the correct data to the KD6PBH display. Other than the baton
 turning it never gets past the sign on message.  I have included A
 sample of the data that I loged from the serial port yesterday 26 Jun.

        The only thing I can see that is a bit strange is the out put
 of the 7805 is 4.88v with or with out load.

     Any help would be appreciated.

Stacey-   The following are snippets I have saved from Usenet:

ranecurl@engin.umich.edu  suggests:

 Digi-Key has just added MCX connectors to their catalog
(1-800-344-4539). The MCX styles are < $6. Digi-Key has no minimum.

grupinski@mail.utexas.edu  suggests:

Pasternack Enterprises
P.O. Box 16759
Irvine, CA 92713-6759
(714) 261-1920

They have MCX crimp plugs for RG174/RG188/RG316 and RG178/RG196 in straight and
right angle, PC board mount and bulkhead mount. Prices range from $6.00 to
$9.00 in QTY. 1-24.

APRSers,

OK guys, don't make fun of this query, 'cause I ain't never tried to QSO the space shuttle before! I need some help! What constitutes a "contact" with the shuttle, and have I accomplished it?

Here's the background: I've had my home APRS station running 7.6e in (S)pace mode since Friday laying in wait for the shuttle to pass over in digital mode...

I came home from work today to find my APRS station telling me "Congratulations..." and when I went to (L)atest Beacons Heard, there was a message saying:

W5RRR-1 @ 261250 #189-is your STS-78 SAREX QSO number.

Did I do it? Is this message the "holy grail of space QSOs" that I've sought all my life? *OR* Did I just hear someone else hitting the jackpot? SOMEBODY TELL ME!

APRS ACTIVITY LIST...
****
APRS SPECIAL EVENT... ACTIVITY LIST   Filed: 270000GMT JUN 96

At noon Saturday, June 29th, the Biannual Singlehanded Sailing Society's (SSS) Solo Yacht race from San Francisco to Kauii, Hawaii will commence. A voyage of about 2300 nautical miles. The various Sailing Vessels (S/V) range in length from 27 feet to 60 feet, a task for one lone sailor, to be attempting.

Mike/WD6EHQ aboard his S/V Foxx Fyre will be sending twice daily position reports on all the 17 yachts in the race, via Amateur Packet HF radio using either Pactor or G-Tor, to Bill/KB6LFM in San Leandro. Also on 20M or 40M via possibly Ron/KG6DV in Hawaii who maintains a MM2 Net on 14065Mhz.

In addition, Bill/KB6LFM will DR all Yacht positions on APRS daily during the approximate 20 day voyage. Many boats have GPS aboard but not as yet equipped to send their positions on APRS HF Ham frequencies automatically for daily tracking. Perhaps on the next race, this will be done with more Amateur licensed skippers, or on an authorized marine HF frequency.

The daily DR tracks for each Yacht, will be sent on 30M/10151/LSB and 40M/7085/LSB. Those GATEWAY HF stations, copying the uplinked positions can then GATE or Downlink to their local VHF frequencies as they desire. Bill/KB6LFM and I will downling to our local VHF/145.01 Bay Area stations in Central California in our Area, as well as 30M/40M HF.

Additional net info on SSS, Skipper profiles and more, can be found at:

If someone else comes up with a better way, use it, but if not...

Use one of those repeater 'atlas' type books that show a graphic map of
each state with repeater locations. Call up your APRS map of that state
and move the cursor to the aproximate location of a particular repeater
in the book and note the Lat/Long on the APRS screen.

I know it's not exact, and it's a real big pain, but if there is no other
way you might want to try it.

Radio Shack carries just such a repeater atlas, published by the ARRL.

Call me a traditionalist, but I think there ought to be at least one
operator present to make a QSO! ;-) I don't know enough about the dos
version to say if that was a full 2-way QSO, I prefer to use a terminal
program with mcon on and mcom on, so I can see everything verified.

APRSdos REPLY COMMENT: GREAT! YES, and NO.

The "CONGRATULATIONS" message says that APRS saw a copy of your
transmitted packet digipeated.  THis means that most everyone else saw it
to.  HOPEFULLY you showed up on everyone elses map!

The W5RRR-1 message however, was just the LATEST packet (TO SOMEONE
ELSE) that you heard  from the shuttle. (If you saw it on the LATEST
screen).  Immediately also  look at the HEARD screen to see how many
packets you heard from W5RR-1,  and then also go look at the ALL BEACONS
page to see a chronological list of all such packets heard from W5RRR-1.

And Finally, to see who it was TO, look on the DIGIS display where the
packet header would have been stored.

SUCCESS!  So you did accomplish the APRS objective of getting your posit
through the digs, but the reward will be that everyone else SHOULD have
seen you.  So far, Im waiting for that first report of an APRS posit!

Your Success was with APRS.  SAREX does not know it or have any record of it.
If you want to get a QSO number, then use conventional packet WITHOUT aprs.
But I was hoping that if APRS was as successful as I am hoping it could
be, that we should be able to get some special SAREX "APRS" endorsement.

TO DO this, I need to see a copy of each POSIT seen via W5RRR-1.  POSITS
only, as shown on your P-LIST.

I hope tomorrow to see lots of those reports coming in.

I'll presume that you'll want voice repeaters.... Not quite the forum for such a question (IMHO) but I'll spit out what I've found for during travels between the MD/DC/VA area and Dallas,TX.

There's about three places that I know of where you can get that information.

1) The ARRL directory plus access to a geographical server that can dish out the lat/lon's for a user specified city/town. This'll take some time to get a GOOD supply of points for your map. Still, the ARRL directory (on floppy disk too) is about the most available source of repeater information.

2) The "HAM_db and Open Repeaters" Book and CD by PerCon, distributed by 'artsci'. The book contains maps and the CD will have the databases of HAM callsigns and OPEN repeaters. The key word here is OPEN. This source contains only open repeaters the lat/lon pairs for the repeaters are on the CD AND are simply the lat/lon for the city inwhich the repeater is located.

   For example: Dallas is a city that covers quite a large area but all the repeaters listed for Dallas all have the same lat/lon which is for a point downtown, not where the actual repeaters reside.

3) About the only place to get the true lat/lon for each repeater would be through each coordinating group for the areas you'll be traveling in. At least for the repeater coordination groups I'm familiar with (or maybe FCC?) require the lat/lon of the repeater for coordination purposes. I'm sure that obtaining this info, if the coordinating organizations give it out, would be a long and possibly frustrating experience *BUT* it would be fairly accurate. :-)

The best bet for my money for traveling purposes is the PerCon book and/or CD. You can get the book w/o the CD for a few $$$'s less. The maps won't be the caliber of the USGS maps but they'll be more than good enough for your trip (been there, done it, although I kept going onto Texas :-). The PerCon maps will not have closed repeaters but you'll get a better idea of where the various towns' repeaters are located, more so than getting just the town/city names from the ARRL directory. With the latter, more preparation work would be needed to see which repeaters are going to be along your travel route. The former is great if you're driving by yourself and don't have a co-pilot to do lookups in the ARRL directory.

Have a safe trip, Rick!

> of the 7805 is 4.88v with or with out load.

I have seen the Garmin-20 not even start if the voltage is not 5.1 Volts
And when I put an AMP meter in series the voltage drop caused the
Garmin-20 not to start. You are getting data but you might want to treek
the output.

----------- Garmin-20 Current readings ---------
Input Voltage 5.12 Volts DC
142 to 149 MA with no antenna  or using the Garmin-45 passive  antenna.
158 to 164 MA with the Garmin-45 Active antenna.
Used a digital Fluke meter.

>The hunk of wire should be 1.8 inches and it should protrude through a
>ground plane with the ground plane attached to the coax shiled.  The
>antenna must see full sky.  No trees.  And it must see this for at least
>20 minutes.

Can take much longer.

And if you will run the NMEA output into Bob's SIGPLOT.BAS program
you can watch the whole process as it steps from one Sat to another.
When it gets three Sats you will see it pause a bit then
boom a location report. You can also plug the GPS data into
MAC/WIN APRS and this will also give a report of the progress.

I have two Garmin-20 now working and one took 1.5 Hr to lock in and I
was using the Garmin ACTIVE antenna places by a window.
The time on that unit was 14 min off before the lock-in.

-----

PS. I have Mac APRS ,DOS APRS and WIN APRS all running on the SAME
laptop Computer   :-0

You should have seen something like:
W5RRR-1*>N0VXY <UA,F>
W5RRR-1*>N0VXY <I;0,0>:#183-is your STS-78 SAREX QSO number.
Which is what I saw yesterday

There will be a list sent out late with a list of stations that made it

Try this on the next packet pass.
-------------------------------

How to Work the Packet Robot on the Shuttle
```

By Bruce Paige, KK5DO
Email: KK5DO@AMSAT.ORG
Posted July 23, 1995

I have found a way to work the shuttle packet robot that always has placed me on the QSL list. It takes about 20 seconds to do and I have made the QSL list every time in the past 2 years.

There is nothing special to making a connection, the hard part is among all the signals the robot hears to make sure it gets a disconnect from you when it requests one.

Here is how I do it.

You cannot use a TNC program becuase I have found them to be to slow to let you know a connect has been made. Usually they wait a second, ring a bell, wait a second and by then, the world has passed you by. I use Procomm Plus (DOS version) and connect to the TNC. I have a Kantronics Data Engine but the type of TNC is irrelevant. My settings for the shuttle are as follows:

```
MONMODE ALL
MONTYPE ALL
MONITOR ON
FRACK 2
```

The other settings that you normally use are just fine. Here is how the connect goes....

Issue your connect command to the TNC. As soon as you see the message on your screen that the Robot has connected *IMMEDIATELY* press your dissconnect key (for me it is CTRL-C to gain control of the TNC and then 'D' for disconnect). The next time the packet robot looks for my confirmation of the disconnect, I will be telling it to disconnect and it is a done deal.

Below are 2 sequences where I connected to the Robot. You will see that the connect was at 14:03:47 and I issued the disconnect at 14:03:51, a mere 4 seconds later. The Robot finally got around to seeing it at 14:04:07, a total of 20 seconds to complete the contact.

Further down you will see the SAREX report of QRZ and QSL and I appear in both. Now I don't have to try any further connects if I hear the Robot and concentrate on a voice contact.

73 and hope this helps everyone make successful QSL connects on the Shuttle.

How accurate is your voltmeter? 4.88 is within 2.5% of 5v. Few voltmeters
have greater accuracy.

I also purchased the GPS-20 via TAPR and have the same problem.
Although I was able to send him commands through a modified MOTOROLA.BAS
program, I think that the problem is in the antenna design I made.

I would appreciate to know where could I find SIGPLOT.BAS ?

965. Icons with KPC-3

From: Miami Network <0004818186@mcimail.com>
Date: Thu, 27 Jun 96 05:18 EST
To: aprssig <aprssig@tapr.org>
Message-ID: <75960627101857/0004818186NA1EM@MCIMAIL.COM>
Rendered body type: text/plain

We have a new APRS WIDE Digi in South Florida operating under
the call sign of N4PBF. It is a Wx Reporting Station and
sends out a Beacon every 5 minutes. The Icon comes out as
the Blue Dot with the White Line pointing into the Wind.

By taking advantage of the LT String we set up the Text

to with the same long and Lat String but put in the # sign
to indicate a DIGI and set the BLT timer to every 00:30:00

Now every 30 minutes the ICON changes from the Blue Dot
to the GREEN Star so stations can also see that it is a WIDE.

At the 5 minute mark the Wx Data will Transmit and then change
back to the Blue Dot.

Looks just neat on the monitor!

Rusty, If you insist on growing your own antennas (can't blame you with
the cost they are today) and use the steel seeds you are not going to
get any significant crops unless you use ROHN 25-45-55 fertilizer at
regular intervals of about every four weeks until the top section
approaches within 3 feet of the desired height. Water with good clean
water that has no sulphur or other contaminates except possibly Iron
and do not attach copper ground rods or any dissimilar wire antennas
to the structure till the maximum growth is obtained. (Usually 3-4
weeks after the last application of Rohn fertilizer) Although ads
indicate similar results with lesser fertilizers like Universal or
USTOWER or the older Tristoa circular fertilizers, they contain too
many impurities and that is when you get copper and aluminum as you
described. 5 bags of Rohn 25-45-55 wil give you 50 feet of tower and
at 55 bucks a bag thats no bargain.

Message-ID: <199606271255.HAA25061@tapr.org>
Rendered body type: text/plain

I have my Garmin 45 working nicely with the pico packet for stand alone
reporting. All is well. I am using the GPCGGA (or something very similar)
sentence. In this mode I report position and altitude...I would think that
position, course and speed would be more appropriate for a car and the
other common sentence would do that GPRMC?

My questions:

1. Will the pico packets gps mode support this other sentence?

2. Will the Garmin output this sentence?

What changes will I need to make to the pico and Garmin parms in order to
achieve this? TIA. 73,

Rendered body type: text/plain

Take a look at this page (I haven't included it here 'cause of size) and tell me if this isn't what we (hams) have been working towards for the past few years. Granted the technology to produce these devices is out of reach of most of us financially and technically, but none the less it mimics what has existed on packet radio for some time only at greater speeds (KA9Q's NOS and its varients).

Now comes along really high-speed (> 14.4Kb) TCP/IP for wireless connections driven by the Internet roar of millions of surfers using miniature radio modems. Its in use now at corporate sites (HP and Microsoft among others).

Supposedlly it offers connectivity to devices that comply with RS-232, does this mean I can hook my TNC or DFjr or Wx station directly up to the 'net ? ? I wonder?

Read and let me know what you think.

At 08:01 AM 6/27/96 -0500, you wrote:

>1. Will the pico packets gps mode support this other sentence?

Yes, but currently the Pico only parses and sends one sentence at a time. The software appears to be there for holding four strings, but the part that times and sends them hasn't yet been finished. I understand that it will be implemented soon.

>2. Will the Garmin output this sentence?

Yes. It already does.
You need $GPRMC for position and speed.

>What changes will I need to make to the pico and Garmin parms in order to
>achieve this?

No changes to the Garmin Parms.
For the Picos, you set GPSTEXT to $GPRMC, assuming you have everything else set up already. You probably have already set the LOC EV xxx command. I don't recall if you said you had the dual port or not. If you do, then you also need to set up other parms to use with the APRS computer.

> Someone wrote: I'll presume that you'll want voice repeaters.... Not quite the forum for such a question (IMHO) but here's what I know ...

APRSdos REPLY COMMENT: Actually, the subject is IDEAL for APRS. I prefer to think of APRS as an INFORMATION RESOURCE for mobile navigators. Some of my early maps actually had our local voice repeaters on the map. APRS can display the location AND RADIO RANGE of all FM voice rpeaters on its MAPS. This would be a nice aid for the traveler. All it takes is for someone to build a BACKUP file for the repeaters in their area. Just use the INPUT-ADD to add the repeaters to the map. The ANTENNA symbol. THen save the file as 2mVA.bk for all VIRGINIA 2m repeaters for example. THen any mobiler can LOAD or REPLAY the file and see the repreaters on the map.

THis is a good example of a simple thing that APRS users can do to serve their community and further demonstrate the potential of APRS.

Be sure to enter the PHG of the voice repeaters so that their radio ranges can be plotted using the MAPS-PLOTS-POWER command!

Good info.  My GPS-20 has been spitting out data from first application
of power, but I have not gotten a fix yet.  Last night I attached a
dipole antenna to my -20, plugged in a battery, and let it sunbathe
(moonbathe, actually) in my back yard for about 30 minutes.  Still
nothing.  Then I let it hang out on my roof, but still nada.  However,
both cases still had trees blocking part of the sky.

I can watch the GPS-22 cycle through different birds, presumably
searching to see what it can find.

My Icom GPS-22 works fine in much worst conditions (it works inside,
where my GP-20 has sat for hours without a clue.

The dipole I've been using is a short (~5 in) chunk of RG-58, with
a BNC connector (which is what's on the outside of my boxed GP-20)
on one end.  On the other end I've separated the shield and coax
(at 1.8 inches long, each), bent them each 90 degrees in different
directions, making a "T".

Unfortunately I don't have any commercial antennas, without ripping
apart my Icom, which I really don't want to do.

Maybe I'll try your groundplane, and find a good, clear parking lot
to hang out in for about 20 minutes.

Sigplot est distribué avec APRS pour DOS.

ftp://ftp.tapr.org/tapr/SIG/aprssig/files/dosstuff/DOSaprs/aprs75c.zip

si tu ne l'as pas déjà.

Pour l'antenne, essaie le "patch" décrit dans QST, l'article est dispo sur
le réseau. Je suis en train de distribuer (pour 2$ pièce) un ampli
monolythique, MAR-6, pour améliorer cette antenne, si tu es interressé, on
peut s'arranger pour en expédier en France.

Comment se porte APRS en France? Y a t il des utilisateurs, et qu'en font ils?

Amitiés.

Bernard, KB2TGH.

The Garmin puts out all standard $gp strings.  The main ones you want to use
are $GPGGA (L/L and Altitude), $GPGLL (Lat/Lon) and $GPRMC (L/L w CSE/SPD).  One
other one that IS going to become useful soon on APRS is the $GPRTE (Waypoints
and Route).

>2. Will the Garmin output this sentence?

N9QGS reply:

I use a KPC-3, the Garin 45 spits al streams out, I dont think there is a
way to tell it what to sent (initalization string), and will support the
$GPRMC, just set up the pico for that string, I assume Pico you had to tel
it somewhere $GPGGA, I would figure just chage this to reflect string
captured, this is how it works with Kantronics.  Good luck

Just a quick note to the sig on "metricom."

I've had a couple of talks with them, and one buddy is
an ex-employee(he took his stock and bought a candle
shop ;-)

The system is very much like a cellular approach to packet
radio(and many of the founders/technical types of the
company ARE hams...) In fact, they started with AX25
as a beginning point and moved on if memory serves...
Originally, the modems were built to be a self-locating
radio system to report meter readings for power companies.
The internet happened, and they were sitting on this
cellular packet system that just fit.  Basically, they
attach little 1W Spread spectrum(hopping)radios to
light poles, and put central hubs in every neighborhood.
Typically, your packets are only a couple of hops from
a higher speed hub.

Thruput varies with one amateur user I know claiming somewhere
between 9600 to 14.4 REAL thruput...as opposed to divide by
4 for our ham packet systems.

Hope this shines some lite on the technology.

Davis offers a fine software package with their WeatherLink option
($165.00). It not only has a nice way of tracking and viewing the data, but
also, allows you to store information without having to leave your computer
turned on. The WxLink comes with a small mini computer that plugs into the
Wx Monitor then into your computer. I hope that this information is helpful.
AA7MH and I are testing the U-2000 and the Wx Monitor II, side by side,
including software, and at this time, though both are accurate, Davis is
leading in the software and data collection area, also the ease of use and
functionality. The test will continue and then we will have some true
empirical data to put out to anyone who is interested without all the
corporate PR & BS.

I appear to have the answer, thanks to N4NEQ, KU0G and an N9...thank you
all.

Simply changing GPSTEXT to $GPRMC should do exactly what I want.
(PicoPacket and Garmin 45 in stand-alone mode, single port), reporting
position, course and speed...instead of the default position and altitude,
which is of very little significance unless you are driving up Pike's
Peak.

I will confirm this works when I get home. Thanks to all who have or, may
reply. It sure is nice to get good help this quickly. 73,

984. WinAPRS status

From: Mark Sproul <sproul@ap.org>
Date: Thu, 27 Jun 1996 13:29:55 -0400
To: aprssig@tapr.org, winaprs@tapr.org
Message-ID: <v03006f03adf870f68be5@[165.1.27.20]>
Rendered body type: text/plain

```
To all WinAPRS users

There have been several comments about the next release of WinAPRS, I will
be releasing soon, this weekend at the latest.

I hope that you dont mind that I took a few weeks to relax after spending
all winter in front of the keyboard.  Also I do a lot of travel during the
summer.  I was just down in Texas and met with several of the APRS users in
Amarillo.

I am TRYING VERY hard to complete the HSP support, it is not finished and
probably wont be in this release, but I AM WORKING on it very hard. (DLLs
are a pain to work with)

The new features for this release are

       Airport display and list
       Winds Aloft display
       Global labels
       Symbol list
       Ability to display ONLY weather stations

       Bugs that have been fixed
       Crash on incoming packet if no windows were open
       HF/VHF terminal window was backwards if both were open
       Several packet parsing errors that caused strange behavior
```

I am updating the documentation for these new features.

I greatly appreciate DETAILED REPRODUCABLE bug reports, I have had several people send very complete comprehensive reports on how they were able to re-create a problem and the steps required to do so. Sending me a Windows stack dump does NOT help at all.

I keep all bug reports that users send and all feature requests

Items that are currently being worked on

HSP (number one priority)
Pico-packet support
Davis weather support (Waiting on sample unit to test with)

Thanks for all of your support.

Mark Sproul

985. APRS QSL cards

From: ku0g@sprynet.com
Date: Thu, 27 Jun 1996 11:49:54 -0700
To: aprssig@tapr.org
Message-ID: <199606271849.LAA19922@m1.sprynet.com>
Rendered body type: text/plain

I asked Bob if his APRS QSL card could be reproduced in quantity so that APRS geeks could get them customized for use as their own QSL cards.

He contacted the company that made his APRS cards and it looks like they could do them as follows:

$110 for 500
$165 for 1000

Bob would have to pay for the initial run of the basic artwork which is $900 for 10,000 cards. He would be reimbursed as the orders came in....

These cards are the same as Bobs cards, but the USA map on Bobs card is reduced by about 25% so that it fits in the top three quarters of the card. Then the bottom quarter has your callletters in BIG BLACK letters on the RED background that currently surrounds Bob's cards. Your name address and personal information appears in black letters on a white background in the lower right.

To see the following diagram in its proper format, expand your message window to full-screen...

```
     -----------------------------------------------------------
     |   ---------------------------------------------------   |
     |   |                                                 |   |
     |   |                                                 |   |
     |   |                                                 |   |
     |   |             BLACK APRS MAP OF USA               |   |
     |   |        with 4 color stations and objects        |   |
     |   |                                                 |   |
     |   |                                                 |   |
     |   |                                                 |   |
     |   ---------------------------------------------------   |
     |   *   *  *   *   * *    * *   -----------------------   |
     |   *  *   *   *  *   *  *      | James  R. Duncan    |   |
     |   * *    *   *  *   *  *  ** | 4719  N.W.  78th St |   |
     |   *  *   *   *  *   *  *   * | Kansas City MO 64151|   |
     |   *   *   * *    * *    * *   -----------------------   |
     -----------------------------------------------------------
```

The last time Bob asked the SIG, he only got 4 replies, so he dropped the idea. We would need 20 orders for 500 or 10 orders for 1000 to make it worthwhile...

SEND REPLIES TO ME, KU0G and lets see if there is interest...

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

Great idea if it would work, but having done a Alabama repeater map for some of
the folks in Alabama, that is of course still handed out at the local Ham store
has so many repeaters on it that in no way would these all fit on an APRS map of
that state. I doubt that i could fit all the local vice repeaters on my local map.

Rendered body type: text/plain

```
Hi,
The GPS-20 seems to have poor preformance compared with other GPSes.
When I first hooked up mine I only got a fix after about 3 hours with
an active antenna put in clear sky view.
Now that my GPS has built the almanc I put it on my windows where it
has a pretty good sky view, with a homemade 1/4 Lambda antenna with a
ground plane and it wont get a fix.
Some time ago I got to play with a Trimble ScoutMaster and on the same
spot on my window it got a fix after about 15 minutes.
Yesterday, on my way home I took the GPS in my car, I mounted the homemade
antenna on the dashboard and still couldnt get a fix.
Maybe we should all build active antennas ?
 bye, Assi

Message-ID: <222@w6dnt.ampr.org>
Rendered body type: text/plain

```
A week ago, Al Chan wrote:

AC> Since we know the locations of the satellites; and we know they
AC> are broadcasting UTC time super-accurately, why not use the
AC> LORAN theory. The RATIO of the time difference (of arrival of
AC> the signals) from two satellites should give us a good
AC> hyperbola. And a third satellite will solve the ambiguity.

    And then Gerald J. Creager wrote:

GC> Wrong, and wrong.  We have an idea from the broadcast ephemeris
GC> where the satellites are, within 20 or so meters.  That's not
GC> precise.  We are concerned with which integer wavelength of the
GC> GPS signal (OK, really which chip from the SS signal, but for
GC> our purposes it's the same) we are receiving.  Not just getting
GC> atime hack.  And finally, the GPS NAV timing signal is broadcast
GC> in Z code, which is based in seconds since start of week.  You
GC> then have to do significant table lookups and logic trails to
GC> make sure you know how many leap seconds, and when, to add 'em
GC> in.

Who is right? I was reading a book, "GPS Made Easy," by Lawrence Letham,
published by Rock Mountain Books, Canada. On page 8 ff. Chapter One, Mr.
Letham described the principle of Loran as I mentioned above. The 3rd
satellite gives the intersection of the two hyperbolas to resolve the
ambiguity; and the 4th one resolve altitude.

AC> Is there any reason why not have LORAN in the sky?

GC> Wavelength is too long?  LORAN is reasonably precise for local
GC> areas without LF/MF multipath and fading, say, within 100 km of
GC> the chain.  LORAN in the sky might just improve that somewhat,
GC> but maintaining the absolute and timing relationships of the
GC> stations (satellites would be interesting.

The Loran principle can be applied to microwave (1.5 GHz) as well as LF/MF.
The wavelength of 1.5 GHz is not too long. Loran DOES use timing
relationship. That's the only way Loran CAN work.

GC> Nope.  The RATIO is nice, but absolute differences are used
GC> after the integer ambiguity is resolved, either by measurement,
GC> algorithm or guess.

Both ratio and differences are necessary. The ratio determines the shape and
curve of the hyperbola. According to Mr. Letham, the GPS works on the very
same principles. (page 8, Introduction.) Please investigate. Thank you.

STS-78 ORBITAL DATA

Below is the current State Vector and Keplerian Elements for STS-78.
The vector data comes from NASA; the orbital parameters were computed
from the vector. Hourly vector updates are available from NASA GSFC
OIG RAID RBBS at (301) 262-6782 or by telnet: oig1.gsfc.nasa.gov
(UserID = oig / Password = goddard1).

```
Vector format = 117
Satellite Name:         STS-78
Catalog Number:         23931  96036A
Epoch Date/Time:        96179.79171643518
                        06/27/1996  19:00:04.299 UTC
EFG E:                          -18282316 ft
    F:                            5889501 ft
    G:                           10288763 ft
    Edot:                        -1047.19 ft/s

Just to let everyone know... this weekend on, Garmin GPS 45's for sale
for $240 at boat US... $230 if you are a member and got the flyer in
the mail... Not bad - seeing it has a BNC for an external antenna,
and the voltage regulator built in.... not to mention the case an
buttons an such.... FYI....

Good luck.

The Western PA repeater council gives *NO* information. Period.

I've been after them for two years to find the best frequency to put my mobile repeater, which will only be used for emergencies. All I get is "There are no two meter channels available".

I've heard that other coordinators aren't so tight-lipped about such information.

995. Garmin-20, Deaf??

From: "Stacey E. Mills, M.D." <sem2r@galen.med.virginia.edu>
Date: Thu, 27 Jun 1996 22:20:07 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960628022007.0067a12c@avery.med.virginia.edu>
Rendered body type: text/plain

I've got to add my sentiments to the others re. this unit. I have a Garmin-45 with which I am quite pleased. The Garmin-20 will lock if I use an active (pre-amp) Garmin fixed-base (marine) antenna and a short (30 ft) run of coax...but conditions have to be perfect and even then the lock takes quite a while. With a 60 ft. run of mini RG-8 coax from the pre-amp on my tower GPS antenna, the Garmin-45 locks in about a minute with good to adequate signal strengths shown on 4-6 satellites .....the Garmin-20 won't lock after hours......on my outside deck with the Garmin-45 standard antenna, I get lock in about a minute with good signal strength....put the antenna on the Garmin-20 and after multiple hours we're still not there.

I have my unit in a cast aluminum box with a BNC connector for the RF, 7805 regulator, floated with two signal diodes in series between the center (gnd) lead of the 7805 and the true ground to give an output voltage of 5.4 volts. (without floating, the voltage is 4.88 volts).

Any ideas??? Got a good design for a pre-amp??? I want the unit for APRS.
I could make it work as a stationary unit for a TAC, but the sensitivity/lock-in time seems to be a major problem for mobile operation.

>Now that my GPS has built the almanc I put it on my windows where it
>has a pretty good sky view, with a homemade 1/4 Lambda antenna with a
>ground plane and it wont get a fix.

I waited to get a fix for 45 min after the almanac was built then I did a power reset and got a fix in 2 min.

Do a sigplot, let it run for 2 hr and send us (FTP APRS file area) the screen save of the results of your homemade 1/4 Lambda antenna.

I guess I should say that Sigplot is a basic program and it is part of the ZIP file in the FULL DOS aprs (The APRSxxx.zip file that is over 1 meg).

Sent: 	Thursday, June 27, 1996 4:01 AM
To: 	aprssig@tapr.org
Subject: 	[APRSSIG:2436] GPS Sentences & APRS

............

My questions:

1. Will the pico packets gps mode support this other sentence?

YOU CAN SPECIFY ANY SENTENCE YOU LIKE - IT DEFAULTS TO $GPGGA. CODE NOW IN
PRELIMINARY TESTING WILL ALLOW YOU TO SPECIFY UP TO FOUR DIFFERENT
SENTENCES TO BE TRANSMITTED.

2. Will the Garmin output this sentence?

What changes will I need to make to the pico and Garmin parms in order to
achieve this?

FOR THE PICOPACKET: GIVE THE COMMAND GPSTEXT FOLLOWED BY THE STRING YOU
WISH TO BE USED. FOR EXAMPLE: GPSTEXT $GPXYZ <CR>

NOTE TO THE PROTOCOL POLICE: I'M RESPONDING IN UPPER CASE TO DIFFERENTIATE
MY RESPONSES FROM HASAN'S TEXT. USING MS EXCHANGE IN 'FORWARD' MODE INSTEAD
OF 'REPLY' MODE TO AVOID THE UNWANTED WINMAIL.DAT ATTACHMENT.

There was no signature on this message, so I don't know who to thank. In
case is was Gwynn, let me say:

Setup: Garmin 45, PicoPacket (1 port) , BlackJack dash antenna (KU0G):

1. I have it working perfectly now with GPSTEXT set to $GPRMC. 2. The pico
packet is one of the nicest tnc's I have ever used. 3. Service at PacComm
is outstanding (customer support).

This morning's 0730 EDT (1130z) pass was the best for packet so far.  I
copied 22 SAREX packets but still no APRS position reports were seen.
Nothing was heard on the next 0905 EDT pass.  We are still waiting on the
first report of an APRS position report.  Keep trying!  The Shuttle
Columbia  callsign is W5RRR-1.  Here is the updated log for the East
Coast:

DAY EDT   ZULU  COMMENTS
--------  ----- -------------
21  1745  2145z Voice KO4HD Fl Keys
21        2238z Voice Guiccone San DIego, and W5GEL Texas
```

```
22  0915  1315z through 1400 on 23 June nothing heard on 9 passes
23  1535  1935z voice heard in S. Fla
23        2110z Voice heard in Calif
24  0740  1140z nothing heard on next 4 passes
24  1355  1755z voice reported in Texas           END FIELD DAT
24  1530  1930z nothing heard on next 3 passes
25  1045  1445z I missed the pass
25  1230  1620z Voice over usa.  THey said Packet soon!
25  1400  1750z Voice over USA
26  0730  1130z Packet reported fm Alabama
26  0904  1304z Packet reported in Houston & East coast
26  1350  1750z packets over USA
26  1500  1900z ? (I missed it. Anyone else have a report?)
27  0725  1125z nothing heard this pass and the 0900 EDT pass
27  1035  1435z voice heard on this and 1610z, and 1745z passes
27  1510  1910z ? (i missed it.  Anyone else have a report?)
28  0725  1125z 22 packets copied in Maryland
28  0900  1300z nothing heard
```

Remember, in SPACE mode, the GRID SQUARE POSIT is inserted in your BEACON. Do not send any APRS packets except your BEACON. Use the XMIT-BEACON command. Do not send APRS messages!

Look on the ALL-BEACONS page to see the list of separate packets heard. Unfortunately it does not show the TO callsin, but it does give more information than the LATEST and D pages show.

Later when things calm down, sending your POSIT might be OK, but that is a much longer packet and is not needed if you send a SPACE MODE BEACON. The SPACE MODE BEACON will put you on the map (using the gridsquare format)

I looked up the specs for the GPS-20, and it is supposed to have a sensitivity of -166 dBW minimum. This is 6 dB better than their TRACKPAC models (-160 dBW). There are 3 people that have reported difficulty in getting a FIX with their GPS-20's. (Porbably half of the usrs have not finished putting their units together yet.)

How many of you have your GPS-20 hooked up an ARE getting good sesnsitivity and fixes?

Reply to me direct, and BRIEFLY (1 screen) and I will summarize.

Sorry Bob but i don't think APRS is working, i know i had no problem
contacting the shuttle (Like before Hi) so it should have sent my gridsquare.

APRSdos REPLY COMMENT: Really? I didnt hear any. But I am frsutrated by
a 150 foot coax run, local pagers, and the fact that my PA amp (with
receive pre-amp) smoked yesterday. SO I am listiening with somewhat poor
ears.. PS congratulations on at least one packet even though no one has
reported a POSIT yet.

Why cant you set two memories, one to 145.55 and one to 144.49 and
switch to the UPLINK when you hit X-B and leave it on DOWNLINK inbetween?

Stacey,

I just finished two GPS-20 units in a cast aluminum boxes (with a
PicoPacket attached to the inside of the lid). Initial fix under trees
(using the Trimble antenna from PacComm) took 15 min on one and 10 min on
the other. Now get fix on either unit in 1-2 min under trees if unit has
been off a day or two and in about 20 secs if unit has been off for a short
time.

Performance almost identical to my Garmin GPS 45 using the same antenna in
same location.

Using 7805 barefoot (5.1 V on one and 4.95 on other).

Ron W5RKN

I am having difficulty in getting the APRS and my older 1278 to communicate.
Since the MFG documentation refers to using a 7 Bit setting, I have been
using that parameter and adjusting the others. A local ham said he could
never get APRS to operate with 7 Bit and suggested I use 8 Bit....problem
is, I can't seem to force the 1278 to operate with that parameter...aarrgh!
Any body been there, done it, and got the T-shirt, using an older 1278?

Uhm...I would suspect that our local coordination group is as tight
lipped as you are sugesting.  NARCC which coordinates Northern CA
has a policy of keeping their dbase completely private.  They only
release a portion of it too the league each year for the repeater
directory.

I'll wager that this policy is more pervasive than you imagine.

Good morning to the sig.
I have a couple of questions about the garmin 45 vs the magellen
trailblazer.  I have a tracker built and plan to use it mobile as soon
as a permanant wide-relay digi is online [waiting for crystals now].
However I am still undecided as to which gps unit I will buy

1:   Does the Magellen have the 99km limit ?

2:   What is the battery life IE how may days/ positions can I expect
     from a set of batteries.  I plan to use it for hiking and
     backpacking as well as a stand alone tracker with a kpc-3.

3:   I would apperciate any comments from owners of each unit
     concerning their personal opinions on durability, customer
     support, ease of use, and overall satisfaction with the unit.
```

Please reply directly to me via e-mail unless the answer is of use to
the sig. The addresses are below.

Please send e-mail to

I'm using my GPS-20 with the PacComm/Trimble $50 active antenna and it works
perfect, satelite acquisition time is even better than I expected.

My *uneducated* guess would be a antenna problem.

Hello,

 This may hve bin asked be 4 so pls excuse the bandwidth.
  I hve bin doing some ant testing on vhf
 over the past few days and wondering abt
 the reasoning 4 hving more than one WIDE in the path?
 example:  APRS VIA WIDE, WIDE, WIDE, WIDE, etc

 It would seem to me that more than one wide would
 lesson chances of being heard rather than
 extend ur range. Wouldn't using just one wide also
 decrease collisions and allow weaker signals from
 vehicles and low power rigs to be heard.

 Thanks fer the time and still hve not figured out
 how to disply a house on hf and a star on vhf
 putting "-, #" don't fly and can find no info
 in hf.txt abt it.

Hi,
This is my first attempt with GPS recievers + antennas.
The papers we recieved with the GPS-20 suggested we build 1/4 Lambda
antenna's, now such antennas tend to look to the horizon which tends
to be good with the LEOs such as the KO-23... , I once made calculations
and found that 66 % of the passes are below 30 Deg elevation.
So the antenna suggested seems logical, today I recieved a copy
of an article in QST about a homemade GPS antenna.
Now the aurther sais - it is better to have an antenna that looks
streight up then to the horizon because it is most likely that
the horizon will be blocked by obsticles when you are mobile.
What say the gps experts ??
Maybe we should build patch antennas ?
bye, Assi

Quite so...   repeater owners do not usually want exact addresses or
coordinates given to the public.  The coordinators honor this.  Until the
average ham could USE coordinates (APRS, GPS, etc)- no one really had a use
for that info except for coordination (or site jumping) issues.

Now, of course, we can use the info for other purposes but I'll bet the
policy will remain the same.

Try using the town name and looking the town up in that Net resource that
gives lat/long of the center of all known towns.  That will give you a
pretty close location most of the time. (Unless you have a guy like  the guy
here locally who kept having his repeater be too close in miles to a
co-channel machine)  He was told to move it, so he just renamed the Mtn and
left it at the same place.  He has since renamed it twice more.  It is
currently named after the owner of the tower.

Sorry- I can't locate the town name database, but I'm sure someone will have
it here and speak up.

>
>73 De Joe N2OOC

I agree as well.  Sticking wires in antenna connectors at 1.5 GHz and having
something work is a little different than loading up a bedspring or rain
gutter on HF.  Guys, get a real antenna. Call up Paccomm and get that
trimble antenna.  I can't even buy 'em from Motorola at cost for that price!

Using a real antenna on a GPS vs a piece of wire (or even the helix that
comes with it) is like going from a handie talkie/rubber duck in the car to
a 25 watt rig and 5/8 antenna!

Ralph

Maybe to perk up development of the WIDE-N scheme of Bob's (and others).  I
hope that soon we will see digis that do not digi the same packet more than
once.  Then you can use 10 wides and go all the way to canada.

I'd like to see all of the TNC code writers go ahead and get on the stick
with a means to do this soon!

I do have my 2 digis set to 3 wides right now.  They only beacon every 10
minutes. It also made for some nice propo during the band opening recently.

My little peeve right now is the inexcusable use of RELAY at the end of a
path.  Twice this week, a mobile stand alone (airborne- even) tracker has
done this and caused every APRS station for probably 3 states to redigi him
once a minute.  We couldn't even watch TV this past weekend due to the TVI
from my APRS antenna which is just above a highly amplified TV antenna.
Usually my own transmissions are far enough apart to not really matter, but
this was every minute.  Grrr... my wife is really down on APRS right now  :)

A 1/4 wave will work just fine for a qso with MIR. I have talked to
them on a 1/4 wave on my truck. Most of the time on 2M if you can hear
them they can hear you.

Well, I agree in principle, and I 've ordered a Trimble active
antenna.....BUT, I have a Garmin-45 and a Garmin active "marine" antenna and
the undeniable fact is that with either the 45's detachable antenna or the
Garmin active antenna (admitted through 80 ft of mini RG-8) my Garmin-45
gets solid locks in no time (1-2 minutes), showing mid-scale readings on 4-6
satellites with either setup. My Garmin-20 won't lock at all on either of
these antennas unless I take the active antenna down from my tower and
shorten the coax to the point (30 ft) where the Garmin-45 shows full max
readings on 4-6 satellites...then and only then can I get a lock (at least I
could a few days ago, I'll repeat it over the weekend). That sure sounds
like my Garmin-20 is a lot less sensitive than the Garmin-45 that I have. I
don't think it's unreasonable to aim for sensitivity equal to the Garmin-45.
Ron Parsons described exactly that (equal sensitivity / lock time) in his
note on the Garmin-20 vs. -45.

My Garmin-20 did lock with the "short coax" active antenna above,
and so it shouldn't require "sky search" only two days later from the same
QTH. The clock is essentially "right on" from this setup. Appropriate
voltage is present on the antenna connector. The RG-174 pigtail is
connected to a through case BNC connector, regulated voltage is 5.4 volts.
NMEA text lines appear instantly on turn on, list satellites in view, and
show transient signal strengths on 0-2 satellites, but that's it after
running multiple hours. I will climb the tower, bring down my active
antenna and shorten the coax, just to confirm that I can still get lock

with the higher signal strengths, but if the 45 can lock easily in this setting, the 20 should as well. It's more than an antenna problem, at least in my case.

Thanks for your help and comments.

GPS sats have nothing to do with KO-23 and the likes.

>I once made calculations
>and found that 66 % of the passes are below 30 Deg elevation.

GPS sat passes are all over the place at the same time, and you have to look everywhere at the same time to be able to get 4 decent signals.

>So the antenna suggested seems logical,

No, at least not for this reason.
What is true is that from a geometrical point of view, you will get a more precise solution if the sats are near the horizon (max distance between each sat). But trees are likely to grow closer to the horizon than right above our heads, so you still want your antenna to see something straight up.

> today I recieved a copy
>of an article in QST about a homemade GPS antenna.
>Now the aurther sais - it is better to have an antenna that looks
>streight up then to the horizon because it is most likely that
>the horizon will be blocked by obsticles when you are mobile.

A patch antenna is by nature somehow directional normal to the patch surface. I suspect the author just put this comment afterward to "justify" the choice of the design versus this fact.
The best antenna for GPS would be this patch "which looks straight up", but sees even better horizontally at the same time!

The qst patch has for advantages to be easy to build and to give reproducible results (not everybody agree on this one, though) without adjustments.

Compared to my garmin 45 helix (connected at the handheld), my patch (with 2.5 m of ordinary coax) gives -similar- results (both antenna at the same place, i.e. on the roof of the car).
The patch does see better vertically than horizontally, and that can be annoying with some sats configurations.
But if I compare the helix with ~2m of coax (so I can move the GPS inside the car and drive), the patch is far better. The worse is the helix fixed to the gps inside the car, near the windshield.
Now with the canopy we have here on Long Island I consistently get poor results, with both antennas, on my way home!

Message-ID: <v02140b00adfa1cbdb6da@[204.251.33.78]>
Rendered body type: text/plain

```
I tested acquisition times on a GPS-20 with three different antennas:

1. A Trimble amplified antenna (from PacComm) 3-4 m of coax
2. The quadrifilar antenna from a GPS 45 very close to GPS
3. A patch antenna from QST with about 2 feet of RG-58

Prior to testing, a fix was obtained and the GPS turned off for several minutes.

In terms of getting a fix after the GPS had been off several minutes, all
three acquired a fix in 1-2 minutes. After the GPS had been off about 10
seconds, the acquisition was 20-30 secs with all three antennas.

In other words, there was no observable difference between the three antennas.

The site was about 30-40% covered with trees.

About three weeks ago, I got the GPS20 engine from TAPR. Put it in a RS box,
used a 7805 regulator to
feed it 5.01vdc, etal.

Took it outside, hooked it to a laptop with dosAPRS (also had winAPRS and
the GPS version of Precison Mapping 2.0). Left it on for an hour using the
antenna from my GARMIN 45. GPS time came up, bunch of sat numbers came up,
GPS sentences came across. Also the GPS time is 5 min off.

BUT, no signal strengths from any sats. And of course, no lat/log. Checked
out to make sure the input voltages were right, checked to see if I had 5vdc
on the center pin of the antenna connector - it did. Even tried using the
"1.8 inch" wire antenna. Nothing works. Put the GARMIN antenna back on my
GARMIN 45, the Garmin 45 got lock in 2 min.

I have tried this three more times... no signal levels from the sats. My
neighbors are wondering why I'm setting in the front yard<g>.

I have read the threads about the long time it takes to initialize the G20.
About you need a real antenna.

Any other ideas... other than a dead receiver?

thanks in advance,

Kent

Someone asked if the DIGI was in fact enabled on SAREX, since we are not seeing any APRS packets.

APRSdos REPLY COMMENT: Yes, because KE4EER has digipeated one packet. SO far, his one packet is the only reported UI frame. We are stiii waiting for the first report of a POSIT! Boy, i wonder if we are really trying.

Comment, if you are not participating because you dont have a radio that can operate split on 144.49 up and 145.55 down, then put it on the uplink. There are more than enough of us listening on the downlink and we will see your POSIT.

For those of you ready to condem this suggestin, think about it, The shuttle is operating in full duplex mode so just because you listen on the downlink, there is absolutely nothing that you can hear that will tell you ANYTHHIHNG about colision avoidance on the uplink.

We need to see lots of people trying!

> decrease collisions and allow weaker signals from
> vehicles and low power rigs to be heard.

APRSdos REPLY COMMENT: Absolutely! There should never (except for the

usual exception for emergencies and very special circumstances) there
should never be more than 2 WIDES in a row. A packet you discribe with 4
WIDES could generate DOZENS of duplicates and totaly saturate the net.
After 2 wides, you must comit to a given diretion and choose specific
DIGI's beyond that: VIA WIDE,WIDE,W3XXX,W4YYY....

> for that info except for coordination (or site jumping) issues.

APRSdos REPLY COMMENT: APRS has always NOT plotted Grid Squares below the
8 mile range in order to maintain the ambiguity of the position. I had
designed this so that Repeater owners could identify their REPEATER
locations using Grid Squares and thereby not reveal their exact location.
The problem is, that the repeater would then appear as a GRID SQUARE, and
not the ANTENNA symbol.

NOT A PROBLEM NOW. As a result of improvements in the SAREX mode, the
next version of APRS allows ANY position report to maintain POSITION
AMBIGUITY! Simply by using the SPACE character in place of a mnumerical
digit in the POSIT, this will tell APRS to maintain the ambguity at that
resolution as follows:

```
     3859.11N    Exact position to nearest 60 feet
     3859.1 N    Symbol and Calsign will not display below 8 miles
     3859   N    Symbol and Callsign will not display below 128 miles
     38     N    Symbol and Callsign will not display below 256 miles
                  (this really only was put in for the DX cluster mode
                  (where stations are plotted according to callsing prefix)
```

P.S. I just finished MD2mrptr.bk, NJ2,rptr.bk and PA2mrptr.bk which can
be loaded or replayed to show the locations of all 2m repeaters in those
states... (They will be posted in a few days...)

Be sure you dont have a kantronices TNC that is echoing its OWN
transmitted packets or that your own radio is echoing back the audio.

If it was, you woul dget an instant congratulations message EVERY time it
transmited. The fact that you are seeing it ONLY when the shuttle is in
view, tells me you are getting DIGIPEATED and SOMEONE OUTTHERE should
have seen your packet. Is anyone else out there in California listening?

APRSdos REPLY COMMENT: Of COURSE! This is a certain cause to prevent
operation. THanks for the reminder. Every monolithic Regulator chip
requires these capacitors if lead lenght is more than a few inches
ANSD/OR if there is no other filtering on the bus in the immmediate
vicinity of the regulator.

Message-ID: <9606290449.AA22713@fe2o3.LONESTAR.ORG>
Rendered body type: text/plain

I only said that the repeater coordinators HAD the information.
I didn't say that they'd necessarily give it out. Yes, quite a
number of repeater owners would rather keep their exact location
a secret. Many times getting a repeater atop a tall building or
on a comms tower is done as a favor, hush-hush, or "put it up but
don't bother us about it"-type of deal. As soon as another group
finds this building/tower/etc and it's better than what they've
got this other group may start saying to the building/tower/etc
owners "Us too, us too!". Well, sometimes that gets them up
there and then again sometimes it gets everyone kicked out of the
"pool". Sometimes a number of repeaters get installed and then
someone forgets that they're guests on that high spot, make a
nuisance or slob of themselves, and things get ruined for
everyone even remotely involved, or the Amateur Service in
general. It's not a pretty sight, lemme assure you.

Surely, anyone who wants to take the time can DF just about any
repeater, get a GPS near the thing, make a listing of the
repeater locations you've found, and hand it out. You may get

some people mad -- you might not care either. :->

BUT passing that "freely" available (no, make that freely
determineable) information around might cause a repeater site to be
lost, maybe a damned good repeater site. Heck, it might even mean
losing a digi or a node site along with a voice repeater. It's
happened before and it can happen again. Please think about those
kind of repercussions before passing around exact locations of
someone else's property without getting their OK first!

Food for thought.   Now to go get some for my tummy. :-O

1050. GRID-IN-BEACON FORMAT

From: kc5ejk@onramp.net (Robert Winingham)
Date: Sat, 29 Jun 1996 01:51:35 -0500
To: aprssig@tapr.org
Message-ID: <v02130500adfa78e2da58@[199.1.11.116]>
Rendered body type: text/plain

```
----------------------------------------------------------------------
     GRID-IN-TO FORMAT:         WB4APR>FM19SX,W5RRR:...

     GRID-IN-BEACON FORMAT:     WB4APR>APRS,W5RRR:@FM19sx]...
                                                  @ means APRS is online
                                                  / means TNC BEACON only
----------------------------------------------------------------------
```

Then what happens if our BTEXT is say ? : [FM19sx]

which I thought was one of the old standards.

Then If we had:

```
------------
UNP      APRS VIA W5RRR-1    and  NOT   UNP  gridsq VIA W5RRR-1
BTEXT    [gridsq]
B        what ever
-------------
```

Then transmitting using a tracker or comm program :

we would see a dig back that looked like:

KC5EJK>W5RRR-1*>APRS:[EM12ou]

Would this not then be received and plotted on ALL version of APRS ???

Just a second note to say that to do the GRID-IN-TO FORMAT command
I think you would type to your TNC:

UNP FN43HB via W5RRR-1

And if you were that lucky person K1HJC   M. Morgan, you would see:

K1HJC>W5RRR-1*>FN43HB [UI]:

his hands to visit.

The crux of the argument seems to be "precise locations". Seems to me that degrees and minutes (not seconds) would be plenty ambiguous; that gives about a mile in any direction.

As for the "nut case with a sledge hammer", I don't think it'll make any difference. The approximate locations of major repeaters is well known, and even if not, it's a simple job to DF it.

I have just been able to receive my first GPS sats with a report of MAX 41
using SIGPLOT.BAS without any preamplifier.

I just cut a piece of RG213U coax and made a 2 turns helix with the inner
wire that I soldered to a female N connector. Then I made a ground plane
loop with the outter
mass wire. I soldered the coax cable coming with the GPS20 kit ant put the
"antenna"
outside of my window of a 3rd floor flat surrounded by other buildings in Paris.
The part of the sky that the "loop antenna" can see is probably no more than
30 deg as
the street is not large...
```

No, I have no idea of the resonant frequency of my antenna... but I think this is encouraging... at least for me and probably others.

So, GPS-20 is not DEATH !

Hi again,

On Fri, 28 Jun 1996 Steve (KA6G) responded, as had others:

>> The Western PA repeater council gives *NO* information.

>Uhm...I would suspect that our local coordination group is
>as tight lipped as you are sugesting ... I'll wager that this
>policy is more pervasive than you imagine.

I suspect (and, for those of you in areas less susceptible to the plague of vandalism than I am) that this is done for the protection of all those thousands of dollars worth of equipment these many clubs have invested, not to mention that of other users of a given repeater site.

You may remember that I operated APRS at Field Day, which we conduct AT the repeater site. I intentionally fudged the location I was transmitting (it was the county's Emergency Operations Center's coordinates which is about three miles away.) Our repeater site also houses that county's sherriff, fire, ambulance and other "official" communication equipment.

There's also an old fire tower on that site. Until two years ago, there was also a small cabin for the person on that firewatch, which hasn't been manned for quite a few years.

About two years ago some miscreant decided to toast his marshmallows by the flames he graciously provided to the cabin.

I think these coordinators are well aware of the potential for such happenstances and this may be, at least, a contributing reason for their "tight-lipped-ness." I can't say as I blame them, which is why I fudged the location I transmitted.

Hi All,

On Fri, 28 Jun 1996 Bob Bruninga wrote:

>Why cant you set two memories, one to 145.55 and one to 144.49

A better question: Why can't you set an odd offset on the rig (such as you'd do if a repeater's output was 146.43 & it's input was one megahertz up, ie: 147.43.)? Here in the New York

City area (almost 200 2 meter repeaters here) this is a common
situation. Most modern rigs (both my Yaesu FT-530 HT & FT-5100
mobile) allow for this by first setting the basic frequency into memory, then programming in the odd offset. By doing so,
you'd automatically be monitoring the downlink and transmitting
on the uplink. 73

I believe it is a lot lower Ed, altough you should have heard it. Just now it
made a pass using voice and they where saying something about being given
another day. And someone posted they had a beacon from N8DEU he also showed on
my map but that may have been direct since his location is only 25 miles from
me. Strange mine didn't make it at the same time his did, except i was running
APRS.

Absolutely frustrating. Nothing heard on any of the 5 passes this Saturday morning. The pass at 0725 to 0733 PDT was above 40 degrees and should have brought some activity.

Bob asked about West Coast stations monitoring. I am located 35 miles North of Los Angeles and have been set up in the Space Mode and Armed using APRS76e for the past three days. I did not record any activity on Thursday or Friday and wanted to actually observe the Saturday passes and see if there were some problems.

FYI, since it was mentioned :-)

Space Shuttle Goes for Record
There were high fives and smiles all round aboard shuttle Columbia today, as mission control confirmed the medical research flight will last a record-breaking 17 days. With the theme from the movie ``Mission Impossible'' playing in the background, spacecraft communicator Chris Hadfield told the crew the mission manager had agreed to let them break the previous record, which was also set by Columbia. That means Columbia is scheduled to return home on the morning of July 7. Columbia's crew is studying the effects of space travel on the human body.

(from Reuters National Summary, 6/29/96, 3pm EDT)

Looks like there's a decent amount of time ahead :-) -rt

Yes, signals are weak. I am using a 10 element horizontal yagi with a
Mirage amp with built in preamp for receive. On the pass this morning,
I could hear it with a Ringo dual band verticle but it was not full
quieting which is what you need to copy fm packet.

> ---------------------------------------------------------------------

Robert Winingham noted that the formats would actually look like the
following on an AEA tnc which uses a non-standard TAPR display format
>
>      KC5EJK>W5RRR-1*>APRS:[EM12ou]
>
>      K1HJC>W5RRR-1*>FN43HB [UI]:

AND I was wrong about the old grid square format that WOULD be [EM12ou]
and not /EM12ou] as I indicated.  ALso, my display above was the
transmitted packet and mine did not show the *'s that the receiving TNC
would add on the display.  Thanks for pointing that out.

Finally seeing some APRS reports.  SAREX signals appear quite weak and
the orientation of the shuttle favors looking aft, meaning you will get
the best singals after it passes you.  With 3 KHz doppler, you might
consider listening on 145.555 and transmitting on 144.485 in this case.
(Note +5 to listen, -5 to transmit.  Reverse these during approach).
* PLEASE include in your reports your LOCATION on this earth, and the
* TIMEZONE of all TIME references.  I am having to send back a request for
* this information on almost EVERY report that comes in...  Thanks.

29        1911z WB6LLO APRS success reported in Calif?
```

WB6LLO reports APRS "SUCCESS" but no one has reported seeing his packet?
Reports from South America include NO SAREX, voice or packets heard.

Remember, in SPACE mode, the GRID SQUARE POSIT is inserted in your
BEACON. Do not send any APRS packets except your BEACON. Use the
XMIT-BEACON command. Do not send APRS messages!

Look on the ALL-BEACONS page to see the list of separate packets heard.
Unfortunately it does not show the TO callsign, but it does give more
information than the LATEST and D pages show.

Later when things calm down, sending your POSIT might be OK, but that is
a much longer packet and is not needed if you send a SPACE MODE BEACON.
The SPACE MODE BEACON will put you on the map (using the gridsquare format)

Hello Group,
The bypass capacitors question/solution was a good one.
Unfortunately, I've had them present between the supply-ground and regulated
output-ground from the beginning. I started with 0.27 uF and the comment
did cause me to up them to 1.0 uF, but this has had no effect. I've tried
batteries as well as power supplies.....

I still get no lock with an antenna setup which will give lock in
about 2 minutes on the Garmin -45. My reading of the comments shows a
definite biphasic set of responses....some (like Ron Parsons) have no
problem, and others are clearly in the deaf mode.....I'd be happy to send my
board to Ron P. or Bob B. to have someone perform and independent "hearing
test."

I just read a message that appeared on our Packet Bulletin Board,
in this message it stated that 144.49 was being used for both the
uplink and downlinking of packet.
It further stated that Voice Operations would be conducted on
145.55 downlink and the 144.9XX series for the uplink.

If this is correct, many of us are listening to the wrong
channel.

Any comments?

73, N6HNY

1081. MacAPRS 2.6.0!!!

From: Keith Sproul <ksproul@rci.rutgers.edu>
Date: Sat, 29 Jun 96 21:07:33 EDT
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.5.836096853.ksproul@niflheim.rutgers.edu>
Rendered body type: text/plain

The long-awaited MacAPRS update is now up on the TAPR and RUTGERS FTP sites.

The new version is 2.6.0 and has a couple of major new features, and many small
things enhanced or fixed.

There were a couple of small bugs in version 2.5.0 so I did not want
to put it up after Dayton. And we were busy getting more features between
the Mac and Windows version to be the same.

New Features:

        * Global Labels
        If you have a favorite set of labels that you would like to see on ALL
        of your maps, put them in normal DOS LABEL format, put them in a file
        and put that file in a folder called LABELS in the MacAPRS folder.
        These labels will appear on ALL maps.

        * Global Label List (so you can see what the labels are)

        * Icon List
        A window that shows all of the ICONs (More of a help/info
        screen than anything else)

        * Lots of new stuff having to do with complex weather display.
        Check out
        http://www-ns.rutgers.edu/~ksproul/APRS/APRSWIND.html
        for more details.
        This has to do with the balloon stuff I am working on.

Minor fixes:

        * The problem where a station would mysteriously move has been fixed.
        Thanks to W5UGQ and KB5WIO for helping track this one down.

        * Many small things having to do with weather input.

        * A couple minor problems with call-book data.

        * Lots of minor improvements in many different areas.
        Too many to mention

Keith & Mark Sproul
(the Sproul Brothers)

1082. GEORGIA Maps

I was working like gangbusters on Georgia maps, but stopped waiting for
the client to send me the maps of the Marathon course. Now it has been

over a week, and Im not sure where I was. Nor whcih computer has the
lates of my work. But Ralph wanted what I have, so I just uploaded it as
GAmaps03.zip. in tapr.org   in tapr/SIG/aprssig/files/upload

I have LOTS more street level maps, but was waiting for the Marathon
route before I spent the time integrating them in to the package.

So what will be in the final version will be more detail from Ga Tech on
up north along the Marathon route..

1083. DFjr results..the real thing

From: stevew@eng.adaptec.com (Steve Wilson x2388)
Date: Sat, 29 Jun 96 20:14:07 PDT
To: aprssig@tapr.org
Message-ID: <9606300314.AA07963@eng.adaptec.com>
Rendered body type: text/plain

I finally got a chance to give the DFjr a serious test
drive today. I took part in the SF Bay area "Pack a
lunch" t-hunt. This hunt has no physical boundaries
except you must be heard at the start...and this was
the first time my partner in crime(wb6w) and myself
had tried this type of hunt. We were also using the
DFjr as our main instrument(the quad & SSB rig were
along too, but we only used that to get an initial
bearing.)

The hunt started in Pleasanton. For those of you
not familiar with this area..Pleasanton sits in a valley
about in the middle of the range of hills that separate
SF bay from California's central valley. Everyone
got bearings pointing out along the Altamont Pass
which is how you get to the valley from there. This
is a narrow valley with hills perhaps 500 to 1000 feet
above the valley floor. We were getting doppler
readings about 40% of the time we were in the pass.
I compared notes with one Roanoke user who didn't get
any doppler readings until he got onto the valley
floor!   So, maybe here the DFjr was giving us
some advantage(though the direction at that point
was obvious...no other way the signal could get there!)

As we cleared the Altamont pass, and started down into
the central valley we got some very strong readings
pointing NE. We actually had the Smeter moving on
the radio at this point, though that only lasted
while we still had elevation. Once we were on the
valley floor we had pretty consistant Doppler headings
the entire run! We put the unit in and out of
averaging mode, and found that we liked the raw
data mode better when the signal was week mainly
cause we could use our own judgment about when
to believe the bearings we were seeing...and the
fact that there is a "LOW" signal indicator
helps with this too!

We followed the bearings out the 580 freeway until
it becomes the 205. Finally, we got a bearing
saying go North young man as we hit the 5
freeway, which is one of the two main arteries
running N/S thru the Central valley. At this
point we'd probably already gone 30 miles.

The bearing pointed right up the freeway for
about 30 miles...and we as we had guessed
the signal started bearing to the West as
we approached Stockon. We got off the freeway
just short of our first chance to cross the
delta water way because we had a pretty good
hard right indicated from the DFjr. The
signal was essentially full scale on the
meter at this point too.

We followed our nose on surface streets till we
ran into the delta channel. At this point
we figured we were within a few hundred
yards of the T, but it looked like it was

on the other side of the channel. We back tracked too the freeway, and crossed the channel, and got back off as soon as we could.

This is when it got interesting instead of easy. The signal had dropped significantly by coming across the river? We ran up and down the river on either side of the freeway, and started getting south bearing vectors? We did see one of the other hunters...we weren't that far off if others were around. The signal dropped down to the S1/S2 range on the meter? The best we could figure is that the guy must be running some sort of super beam and we were on the very back side of it...we didn't particularly like that theory though cause we should have seen a much stronger signal than we were.

When all else fails...follow your instruments.

The DFjr was reliably pointing South now...so we went south. Within a few minutes we got to an intersection we had already traversed and the signal was still s2? The meter had been full scale when we had been here before and the bearings had been north towards the river?

Anyway...south we went along a frontage road to the freeway...and south and south a good 5 or 8 miles. The vector was creeping slowly towards a 90 degree vector...and just at about at a sign that announced a county park, the vector stayed 90 reliably, and even went beyond 90 a bit...time for a right turn. We come barrowling down the road towards a levy and this park at which point our proximty detector(HT with no antenna) goes off. The only parking was IN the park...$4 later.sheesh. This is where we finally found the T...why hadn't we found him here earlier as we headed north on the freeway...because he was in a boat and he moved!

We essentially followed him down the channel as he relocated the boat! We think he moved when we got near the river...we didn't see him...but he must have seen us or one of our co-horts.

We weren't the first hunter to located him. Another Roanoke Doppler equipped team got there first by about 10 minutes. They had taken roughly the same track as we did, i.e. all the way to Stockton, then back. Total distance traveled was about 70 miles! The next team rolled in about 10 minutes after we got there... also Roanoke equipped.

It's hard to say who won this one.... if the boat had stayed put another 5 minutes..we would have found him in the channel 30 minutes earlier....but he didn't. I guess the winner was anyone who managed to keep up with him!

Overall, the DFjr performed admirably. We NEVER got the Quad out, and this was definately a weak signal hunt at the beginning. The boat was running 20W into a gain vertical... and some how bouncing up the Altamont pass successfully. We always had some sort of doppler indication on the signal! Hey...I think I got my money's worth!

Rendered body type: text/plain

```
Also, when you detect packets from the shuttle, it would be nice if you
mentioned what the current QSL serial number is...

DOnt forget, tell me your CALL, YOur location (generally) and time in UTC!

And if you see an APRS POSIT, quote it exactly..

PRELIMINARY unofficial RESULTS:
1) not a lot of opportunities
2) weak signals
3) APRS is NOT interfereing with the QSO ROBOT! hi hi
4) Not enough APRS stations trying???? (How can we prove or disprove this?)

Here, when I listen on the packet uplink, I do NOT hear but an
occassional other local attempting packet uplink.  I contrast this with
some of the earlier SAREX packet missions where several statiosn were
usually heard...  But then, these are working hour passes and that was
years ago...

The other day I asked if there is a Linux version of APRS and got no
response, I'll take that as a 'no'.

So, is there a source distribution of either DOS/Win APRS or Mac APRS
available anywhere?

APRS sounds like something I'd like to play around with, but I only
have Linux at home.

1087. FL APRS Page Updated

From: n2czf@magg.net (Richard Garcia)
Date: Sun, 30 Jun 1996 00:20:24 -0400

To: aprssig@tapr.org
Cc: ldevillo@magg.net
Message-ID: <199606300420.AAA25835@grumpy.magg.net>
Rendered body type: text/plain

Several new updates have been added to the Florida APRS Home Page. A few bits of new news and quite a few new Links to ARES/RACES groups in the state and also FEMA, the Red Cross and some others.

I have also added a survey to the page so please fill this form out when you check in. The form is geared to get a better understanding of where APRS activity is going on Florida and also to get a list of active APRS users on Internet. Those of you with Java Compatable browsers will have a good laugh when you click on to the form page. I hope you can all read FAST!

>The other day I asked if there is a Linux version of APRS and got no
>response, I'll take that as a 'no'.

At Dayton, we had an ALPHA version of X-APRS running.
We got lots of good comments on this, from people that recognized that it was indeed a SUN running X-Windows and not Microsoft Windows.

X-APRS is a a fully compatible version of APRS that runs under X-Windows.

We do not have a time estimate for the release of X-APRS yet, but we might have it in beta by the end of the year (NO PROMISES).

For those note familiar with Unix systems, X-Windows is the Graphical User Interface that runs on UNIX systems.

>So, is there a source distribution of either DOS/Win APRS or Mac APRS
>available anywhere?

No, Source is NOT available.

Well seen some packets this morning, signal was very weak, i did get a message
on my V screen stating CONGRATS!! your oacket was digipeated, Does it mean my
beacon was finally digipeated?. If so did anyone see me, i'm starting to think
this is not working hi. Here are the beacons i seen.

APRSdos REPLY COMMENT: There are two subtle notes about FILE-SAVE:
1) It does not save the DIGI'S-PAGE
2) If you give it the name of BACKUP, then it will NOT save the LOG and
   track history files.  This is since it always saves BACKUP when it
   exits APRS, it doesnt waste space with the LOG and TRACK history
   unless you give it another name.

It only saves what it sees on the L, P, Heard, and other lists.
APRS listening to only one station W5RRR will only show one entry on the
L page, even if 100 QSO packets were logged, since ALL 100 were from the
same station.  Look on the ALL-BEACONS page to see the multiple packets...

I am surprised that the SAREX activity has been much higher than I thought:
* SAREX active every day for 10 days except for the 22nd
* There have been 11 voice passes and 10 packet robot passes so far
* There have been 15 passes with no activity (not counting the 5 on 22nd)
* So on a pass/pass basis, SAREX has been active on almost 60% of the
  passes (except for 22 June).

Bob's comment in message #2564 regarding what the SAREX ROBOT
does when it issues a disconnect and gets no response would
explain what I saw this AM:

(H)eard Log: 1 @ 0600 CDT
(D)igipeaters Used: *W5RRR-1 > SAREX

No "CONGRATS!!!..." message this morning (darn it!). I've had
two times where APRS 7.6e (beta) has told me that I've
digipeated, but nobody thus far has seen it. I'm going to check
my TNC as per Bob's message #2565 to *ENSURE* that I'm set for
"GRIDSQUARE via W5RRR-1".

On the bright side, we still have all week to keep trying...

Hi Bob and the newgroup. Bob, you indicated wanting to know of sucess
with newer users such as myself. Yes, mine works fine obtaining a lockon
just minutes ago. A suggestion for others: I made a temporary antenna by
stripping back 1 7/8 inches of the provided RG174 coax outter covering,
then unbraided the shield finally twisting the shield into four "ground
planes". The inner conductor was left intact with the polyethlene
covering. All this does is make a simple antenna BUT has the advantage of
preventing shorts to the internal conductor, which would be disaster.
     I could NOT get a lockon inside the house. The unit had to be placed
outside. Once that was done, lockon occurred in 17 minutes with a brand
new unit never have been in this area. Cliff Buttschardt K7RR

Author: Bob Bruninga <bruninga@nadn.navy.mil> at CCGATE
Date: 6/30/96 11:12 AM

I am surprised that the SAREX activity has been much higher than I thought:
* SAREX active every day for 10 days except for the 22nd
* There have been 11 voice passes and 10 packet robot passes so far
* There have been 15 passes with no activity (not counting the 5 on 22nd)
* So on a pass/pass basis, SAREX has been active on almost 60% of the
  passes (except for 22 June).

1104. Repeater locations

From: "Chris T. Thompson" <104357.130@CompuServe.COM>
Date: 30 Jun 96 15:34:34 EDT
To: aprssig <aprssig@tapr.org>
Message-ID: <960630193433_104357.130_IHS82-1@CompuServe.COM>
Rendered body type: text/plain

I've been reading the mail here about the disclosure of repeater locations for maps and such and have the following comment.

Our club repeater site is locked inside a steel cargo container and is surrounded by 10 foot high fencing with razor wire at the top and bottom. As a club rule we do not disclose more information on the location of it than the city its located in. For that matter, I don't believe more than 30 of the clubs 200+ members know where it is. And guess what. At least once a year somebody risks life and limb to either break in or vandalize it.

Please take my advise and keep this kind of information quiet. There aren't that many bad eggs in this hobby but it only takes one or two to ruin your day and your machine.

Chris N1NIQ

Just replace the word "MIR" with the word "Space shuttle" and note the Shuttle packet uplink frequency is 144.490 and is not simplex but is "SPLIT" mode.

[Info via Dave Mullenix, N9LTD]
* MORE MIR OPERATING HINTS *
============================
...comments on the effect that Doppler shift plays in communicating with a simplex communications satellite such as the Amateur Radio station on Mir.

Doppler shift is nothing new in satellite communications, but it takes on an interesting "twist" when a simplex communications link is employed. Doppler shift is the apparent frequency change observed as the result of the motion of either the transmitter or the receiver in a communications link. Both the satellite's motion and the Earth's rotation contribute to Doppler shift, with the satellite's motion playing the larger role. Doppler shift's magnitude is determined by the rate of motion, while its polarity is determined by the direction of motion. The polarity is also determined by whether the transmitter or the receiver is in motion.

When Mir is approching your ground station, the spacecraft appears to be moving towards you at a high rate of speed. This motion causes the signal received from Mir to appear about 3.5 kHz ABOVE Mir's actual transmitting frequency of 145.550 MHz. At the same time, while Mir races toward your ground station, it receives signals from your uplink transmitter about 3.5 kHz ABOVE your actual transmitting frequency.

No Doppler shift compensation is performed on the Mir spacecraft.
All compensation must all be handled by individual ground stations.

In order to compensate for the effects of Doppler shift, ground stations wishing to communicate with Mir must tune their receivers several kilohertz ABOVE 145.550 MHz at the time of acquisition of signal (AOS), AND their transmitters several kilohertz BELOW 145.550 MHz. This involves transmitting and receiving on separate (split) frequencies approximately 7 kHz apart. Most ground stations use transceivers that transmit on the same frequency on which they receive (simplex), and if they tune their transceivers 3.5 kHz (or 5 kHz if their equipment tunes in 5 kHz steps) above 145.550 MHz at the start of a pass, their uplink signals are received 7 kHz (or 8.5 kHz) ABOVE what the Mir space station receiver is tuned to. The chances of establishing a radio contact under these conditions are extremely remote, even if there are no other ground stations competing for Mir's uplink receiver.

Around the time of closest approach (TCA), which also occurs around the time of maximum elevation for satellites such as Mir in circular orbits, the Doppler shift between Mir and the ground station approaches zero. It then quickly reverses polarity as Mir recedes at an ever increasing rate away from the ground station. At TCA, it is safe for ground stations to set their transceivers to 145.550 MHz and not worry about Doppler shift. As Mir recedes however, stations should tune their receivers several kilohertz BELOW 145.550 MHz, and their uplink transmitters several kilohertz ABOVE 145.550 MHz to compensate for the increasing Doppler shift. Failure to properly compensate for the Doppler shift on the uplink would, again, result in the ground station's signal falling outside the passband of the narrowband FM receiver on Mir shortly after TCA. As Doppler shift increases, so must the split between the ground station's transmitting and receiving frequencies. As DOWNLINK signals drift DOWN in frequency during a pass, UPLINK signals must drift UP. T/R offset is zero at TCA, and maximum at AOS and LOS.

The effects of Doppler shift play a greater role in packet radio communications than they do in FM voice communications. 1200 baud packet radio communications (1 kHz shift AFSK on a narrowband FM carrier) occupy a much greater signal bandwidth than does FM voice, 1200 baud Manchester encoded FSK, or even 9600 baud FSK packet. If an uplink signal isn't properly centered within the passband of the FM receiver on Mir, it will be received with severe distortion if it is received at all. Tests have shown that a 1200 baud FM packet signal must be strong enough to produce at least 25 dB of receiver quieting for an acceptable bit error rate performance. Along the same lines, if other stations are competing with one another on the uplink frequency, it would take a signal strength at least 25 dB above the SUM TOTAL OF ALL OTHER SIGNALS on frequency to be received reliably on Mir because of the capture effect of FM. If just one bit of a packet frame is received in error, then the entire packet frame is damaged and must be re-sent by the transmitting station until it is received cleanly without error. Incidientially, a signal 25 dB (300 times) stronger than the sum total of all others is an ASTRONOMICAL signal level even if only a few other ground stations are colliding with one another on Mir's uplink frequency. That's why QRM is so damaging and following proper operating procedures is so important when communicating with Mir.

I am using APRS 74.B in space mode and everytime my system transmits the beacon, I get a message that my packet was digipeated and the Mode is
reset
to Sucess. I have tried to turn ECHO off but it doesn't stay off. I am
using a KPC-3
TNC. Is there another parm that needs to be changed?

APRS SAREX report...copied the signals, but were so weak that it didn't
even show
on the radio display. Time was 1045Z location: 3013.81N 08540.35W

AT 1609z I heard KC7NHZ calling another station from the
Shuttle...transmission
time was short but fairly clear.

Rendered body type: text/plain

The equipment has finally been put together and ran thru its paces. It tool a bit of wire routing and hair pulling, but I finally got all the equipment to talk to each other and working. I took my pile of electronics out on a "special" t-hunt this weekend.

Sometime saturday morning, I got a call from a fellow ham on the repeater stating that he thought he was hearing a call for help on the 52 freq. I usually monitor that frequency, but that morning I wasn't scanning. After a QSY I found him. Sure enuf, a fellow ham (call intentionaly left out!) was stranded on the Buffulo River without a paddle. Seems he'd forgot to "train the XYL" in seamanship of a canoe. Three rapids and a dumped boat later, thier stuff was scattered. My thought was to get a desciption of his location from him, but that would take up a lot of time and battery, not to mention the ham was not from "down south". So, I thought, what a great way to use the DFjr, APRS thangy!

There a now fewer access roads to the river, thanks to the *$$%^(# Park Service, so I needed help from a few of my APRS buds. After getting the initial fix and plotting it we had a starting point. Unfortunately, there were two roads, 4 miles apart on the river, on different sides but it took about 35 miles to go around. In these hills your signal is bounced from one end to the other and can get ya turned around in a hurry. So, I took another heading at a new location and got a report from a QTH DF. We now had a "good" fix. We called the ham on the radio and told him to gather up his stuff, the wet XYL and climb in the canoe, as he was less than a few hundred yards to his take-out point and could float there in a few minutes!!!

I think he was being confused by the wet XYL, but ya never know......the next time it could be a REAL emergency!

Without the DFjr, GPS and APRS, we would not have found him so easily. My hats off to Bob and Joe for the hard work and time that it took in developing this software and equipment. I just can't wait to try it out on a "real" t-hunt.....grin...

Currently, that answer is correct. There is a Linux version coming. Release date, as I understand it, is "Real Soon Now".

(Back when I ran a phone BBS, "Real Soon Now" meant that it was actively being worked on, but was not ready for release.)

My point is that even though you take great pains to keep its location
secret, anyone that wants to can find it.  Just plunk a DFjr or Roanoke
unit on the car and drive straight to it.  (Or a DDDF or a beam.  Even
body-shielding an HT.)

Making the degrees and minutes publicly available would give a one mile
ambiguity.  Or, using tenths of degrees gives approximately a six mile
ambiguity.  This would be sufficient resolution for mapmaking, but not
to physically find a repeater.

I really dont think but a few of us are trying.

1)  Stats are running VERY LOW,  WIth all my SAREX and APRtrak efforts
```

```
    this is going to be very embarrassing..  We are NOT lighting up the
    map like I promised!
2)  There are 80 stations on my local 145.79 map.  I have been sending a
    BULLETIN about SAREX to the net all week.  Only ONE station has
    indicated he is trying.  And I hear NO ONE on the uplink locally.
3)  IS SOMEONE IN YOUR AREA BEACONING BULLETINS ABOUT SAREX???  If not,
    how do you expect them to know about it?  I would guess there are onlyu
    30 stations here on the sig trying.  COmpare that to 10,000 trying
    to connect.

*** IF you WERE trying, and WERE on 144.49 TRANSMIT and were on 145.55
RECEIVE and EVERYTHING WAS PROPERLY CONIFIGURED **AND** YOU WERE
OPERATING DURING A SAREX PACKET PASS, then tell me  how many passes.
If you were doing somethig wrong, then dont count it.  I only want to
count stations that were legitimately sending GOOD APRS packets during
GOOD PACKET passes.  THanks,  SNED TO ME PERSONALLY, I wll tally it up.

Rendered body type: text/plain

```
Hi all,

     After about three days of puzzling over it, rewiring the
connectors three or four times and innumerable (so it seemed)
false starts, I finally got the bloody thing working!  We're
so used to needing to put those pesky resistors and capacitors
in the connector that I overlooked something PaccComm thought-
fully provided in the PicoPacket:  They INCLUDE THESE COMPON-
ENTS INSIDE THE TNC!  If you're gonna use the thing with an HT,
there's no need to go piddling with them, making for a fragile
connector which will eventually be prone to fixing or replace-
ment.

     Before you fire up APRS with this unit, remember to edit
your "inittapr.tnc", "restore.tnc" and "cfig75b.apr" files so
the proper parameters are set when you enter and leave the pro-
gram.  The ones I've set (in addition to the defaults) are:

INITTAPR.TNC

GPSI GPSItext
GPSTE $GPGGA
LOC Every 1200
LPATH APRS VIA WA2JNF-4,KA3ODJ-8,WIDE
MY N2ZRC-9
MYA ARTEMX
U APRS VIA WA2JNF-4,KA3ODJ-8,WIDE

RESTORE.TNC

Similar to above, except LOC 300 (for when I'm mobile.)

CFIG75B.APR

Change the callsign to some SSID other than your base (DON'T
change the number of characters in either of these statements!)

Change the symbol to something other than that of your base (I
use > which is a car.)

     The only problems I've seen so far are due to the physical
layout of my shack and apartment.  The window of my shack faces
west, and is the ONLY one on this side of the building that
does!  All the others face north.  Thus, I could only make the
antenna see one quadrant of the sky (which makes for very in-
termittent locks.)  I now have the antenna at the end of a hoc-
key stick which extends beyond the corner of the building and
allows it to see from west to north to east.  It looks WEIRD,
but I got a lock and haven't lost it yet.

     The other problem lies with my great fortune in living a
half an air mile, and in line of sight with, the two tallest
buildings in The Bronx.  Officially named Tracy Towers, I call
```

them "Pager Heaven!" There are numerous high-power pager repeaters there and are extremely annoying at times (does anybody happen to have a 105 howitzer I can borrow 8-).) I have the DCI 2 meter and 70cm filters on my main (mobile) rig but, because of the physical layout of the shack, can't use them on the HT with which I'm running APRS at the moment.

Those of you in the NY-NJ-CT-PA area, keep a lookout for N2ZRC-9! I'll be putting this sucker to work soon. 73 de

NO NO NO, it is NOT real soon,

we had a demo show maps at Dayton. This was ONLY the map display portion and proof of concept. We WILL have a fully functional, fully compatible version for X-Windows. The current SCHEDULE is

we MIGHT, I repeat MIGHT have beta around X-mas, we hope to release at Dayton (does this have a familiar ring to it or what?)

DO NOT bug us about it, if you have specific questions ok, we are still busy on WinAPRS.

Just for those curious, it will again be the same source code, after porting to MS-Windows, the port to get maps drawing on X-Windows took 3 days. I expect the X version to be WONDERFULLY easy compaired to MS-Windows. We have most of the port already designed, just all of the implementation yet to do.

Mark

Sounds exactly like the description of "Real Soon Now" that I'm used to...  <G>

"RSN" has also been known to mean "It'll be out by Christmas.  Couldn't tell you
which year, though."

Didn't intend to mislead anyone; I thought I described what "Real Soon Now"
really meant...  just a stock answer to the eternal question.  On the order of
"When it's ready".

Rendered body type: text/plain

Last report, I observed that the SAREX activity actually has been pretty high (about 60%). But I just realized that this does NOT include the scheduled School contacts which we would not hear on 145.55. So I will try to include that in the next report..

* SAREX active every day for 11 days except for the 22nd
* There have been 12 voice passes and 14 packet robot passes so far
* There have been 18 passes with no activity (not counting the 5 on 22nd)
  (many of these could be SCHOOL passes)
* So on a pass/pass basis, SAREX has been active on almost 60% of the
  passes (except for 22 June). 33% have been packet!

FYI Folks

1 800 555 1212  is 800 (and 888) directory information.  In other words
if you call that number and give the operator the name of the company (and
if they have multiple locations - a location or area of the country), the
operator can give you ANY 800 or 888 toll free number.

BTW, I goofed in the original posting and said "this weekend on" .... for
some reason this laptop has a goofy keyboard mouse interaction... it should
have read "this weekend on 28-29 June"  sorry... sale over - but I'm sure
that price will be seen again...

I too have owned both a Garmin and Magellan...   got rid of the Magellan..

Heard packets on 145.55 this pass (1246Z), but didn't copy any solid enough to get a decode. They exhibited a lot of doppler and matched the predicted orbital times, so I'm assuming that it was STS-78 - this time I tried matching doppler on the up/down (let's see Bob, that's 145.555/144.485 approaching and 145.455/144.495 receding, right?) and thought I might have heard a digi in response, but without the decode I can't be sure.

Rendered body type: text/plain

Well, after leaving my "deaf" GPS-20 running over the weekend for several hours, I came in to find that the unit had quit all together....no NMEA output of any kind. Voltage in was fine at regulated (5.14 v)....output connections all fine, switching to my GPS-45 with the same software/cabling worked fine, etc ,etc,. The failure was spontaneous with no "help" on my part.

After multiple repeat tries, scrutinizing the board, etc, I can find no abnormalities. I guess it's send back time...such is life.

ATTN: APRS USERS..   Filed: 011300GMT JUL 96

Have received several packet messages from TED/HC5K, in Ecuador concerning his forthcoming APRS involvement from his QTH. He hasn't mentioned his town. Hi...

He has a PacComm Tiny-2/MK2, GPS and a KAM+ and wants to run a GATEWAY with the Kam and asked for HELP. Gonna run GPS tracking from his car and get his mobile Gated on 30M/10151/LSB. Has been copying 30M and gave me calls of 15 APRS users, mostly from midwest/east and from FL to Canada, so is copying you'all.
Also he is the only SYSOP in Ecuador.

His US packet address: HC5K@NO8M.#NE0H.OH.USA.NA
Internet: etjm@az.pro.ec

He lacks good maps of his area, so if anyone can QSO and possibly provide couple good maps for his area/town, wherever that is, would

```
be nice to help him out. Says he has good local paper maps of his area.

  Gave him aprssig@tapr.org address and how to join the SIG and hints
on setting up KAM to Gate HF traffic. Info on setting up and using his
GPS mobile for his local tracking.
   So if any APRS user, would like to help the Gentelman out further,
drop him a line if you like.
       APRS, TRY IT, YOU'LL LIKE IT...

  73's & Enjoy, Bill/WB6LPG @ KA6EYH

What's needed possibly is a little reversed psychology.
Forget all the security measures and mount the repeater
on a US Mail box in a highly visible area.
Put a sign on it telling what it is and value.
Next tell everyone where it's located and nobody will care.

Moral is:
        When one can openly admit they have no control
over something, the need for an other to take it will be gone.

>all I guess I'll keep lookin'.

No problem.  I think it brought up a very valid topic -- since APRS is quite
exact, and it's the least expensive tool of its kind, it has great potential
for stuff like that.  Every tool has two sides, a good side and a bad side.
Look at hammers, knives, screwdrivers, WWW browsers, et al.  APRS is no
different -- it can be used for good (finding repeaters as you drive along
so you can chat) or bad (finding repeaters as you drive along so you can get
a new black blinky box for your shack).

Keep that in mind.  I can't see any of the active list members using it for
bad purposes, but we aren't the only ones using it.  I'm not saying that
```

```
APRS should be turned into an exclusive tool for personal friends of Bob,
nor am I saying it should be pruned into APRS Lite or something.  I am
saying that we should remember that every feature stuck into it has the
potential for abuse, and ergo, the attention of less-understanding powers
that be.  -rt

Rendered body type: text/plain

```
Hi,

I too got my GPS-20 running this weekend. I wired the GPS-20 up on a hunk of
perf board along with a Maxim switching regulator board to provide the
GPS-20 with 5VDC.

I have a GPS-26, the Garmin active antenna. I connected this to a 20 foot
extension cable and ran the cable through the window. I had to try several
places outside to get a lock. I ended up puting it up on the patio rafters
so that it could see more of the sky. Its first lock took 20-30 minutes.
Relocks take only a couple of minutes now.

I checked the current draw. GPS-20 by itself is about 70mA. Their lit says
max of around 180 mA. The active antenna draws about 10-15 mA more.

I am watching the data on a terminal program on a PC.

Now waiting for my LCD display module, then into a box.

APRSdos REPLY COMMENT: I though I posted a response that announced the
next version of APRS *CAN* maintain position ambiguity. Just use the
"SPACE" character instead of a numeral in the APRS posit format. Then
APRS will NOT display the object below a certain display scale:

3958.11N	Exact location
3958.1 N	Will not display below 8 miles
3958 N	Will not display below 128 miles.
39 N	Will not display below 512 miles.

> > during approach).

If aft is favored it might explain why signals have only rarely been
heard on this mission.  The spacecraft rarely flies belly down and nose
foreward on orbit.  Quite often it is nose down, which would point the
aft-favoring antenna into deep space.

Suggest checking NASA TV where possible for updates on spacecraft
attitude.  Quite often they show spacecraft attitude over the positional
map of the globe.  With an aft favored antenna, nose straight up would be
the ideal position for SAREX.

```
I stupidly attempted to connect an MFJ-8621 data radio
to a Kantronics KPC-3.  Forget it!  The MFJ radio
has no squelch and the KPC-3 has a dumb "energy present"
carrier detector.  The no-signal white noise from the
data radio keeps the KPC-3 carrier detector ON all the time.

I suppose I should have tested them together *before*
I spent $30 for the GPS eprom from Kantronics.

Too bad. They would have made a nice pair... unless
someone has a fix for this?

Really !!
Ive really pissed off some people in my life (ask any HAM in South Florida)
but a joke like that on an open forum is not too smart....
Especially since my friend was flying out that day on VALUE JET and it took
me about 3 hours to find out she was not on that flight. Man was I
worried...
BTW, no one did plot the location of the crash. I havent seen it on the map
here since it happened....
We did getr lots of msgs and plots of the brothers to the rescue shoot down,
and I have logs of various airplanes of them flying around down there...

37. HELP WITH TNC CODE

From: KD4EMI@aol.com
Date: Mon, 1 Jul 1996 18:15:09 -0400
To: aprssig@tapr.org
Message-ID: <960701181508_345635997@emout09.mail.aol.com>
Rendered body type: text/plain

I got to thinking..Ive got the BASIC stamp thing kinda worked out but
thought about TNC EPROMS..

What does the code look like in those things...?

Ive seen other EPROMS with TAPR stuff, or other code used in certain TNC'S...
Is this hard to learn ? What is it...? Can I use it to reprogram a TNC and
burn my own code ?

Can you send some examples of TNC code ?
Why dont we write some code to add some accesory functions, then just sell
reprogrammed EMPROMS for cheap ??

Any help would be apprec..

Dale,
Try these commands:

interface terminal

and

cd software

Out of the box, the kpc3 won't work with aprs or a non-squelch radio.

There are some changes you haveta make.

I am using a MFJ 8621 and KPC-3 - they work very well together, PROVIDED that you set carrier detect to SOFTWARE(default is INTERNAL). Once done, the combo is fine.

Funny thing, the human mind.  If you read the joke literally there
is absolutly nothing to be upset about.  Gators dining on the contents
of scattered airline food trays in a swamp isn't too disgusting (although
the airline food *is*).   Some readers of the joke created a morbid
image in their own mind about what was meant by the term "airline food"
and cried "bad taste" .   Well, I agree. Airline food does taste bad. ;-)

Now, if those who created this morbid image in their own minds
had simply remained quiet on the side lines instead of generating
a reply which *QUOTED THE (alleged) OFFENSIVE JOKE* this thread would
be dead by now.

I just downloaded waprs110.zip, unziped it, got it working.

Still no support for HSP... coming..

Does address the correct VHF port when you open the converse mode.

Tried running the airports list. NO list. Did I miss something?

Still NO help file inside winAPRS.

Does is support the dfJR correctly yet? ... to include the dual port adaptor? HSP?

thanks,

Kent

> Rick O'Hearn
> KF4CDO
> 36'46"N76'06"W
> At first glance, the Meridian XL seems to be a better buy until you try to use it as a handheld GPS receiver. I originally purchased one from West Marine in Dallas after the sales pitch and used it on the way home in my truck. The receiver works well, aquiring initial lock in about 10 minutes out of the box. A Garmin took almost 20 minutes in the same parking lot. Set-up is easy with the menus and scroll buttons. Output is NMEA standard and can be configured for 9600 baud. No problems were encountered interfacing to my KPC-3 for standalone tracker. Not until later did I notice the rapid battery consumption.
6 hours with fresh alkalines was the max, forget ni-cads! Sure, you could use the supplied power/data cable in a vehicle, it works very well and is routed out the side of the case, unlike the rear blob mount on a Garmin 45. Also, on the road I noticed a lag in my displayed location and speed, up to several minutes and miles per hour. External amplified antennas provided no help. The single biggest drawback is the display.

```
Large numbers and configurable display but poor contrast and lighting,
even with adjustments.  You must also look straight at it due to
distortion caused by the curved faceplate.  Side by side comparison with
a Garmin 45 told me I had made the wrong choice.  Good thing WEST has a
no-questions asked return policy for 30 days.  The Garmin is a much
better unit in my opinion, even though it doesn't include the power/data
cable.  You get what you pay for in this case.

btw:  My first Garmin 45 was not without it's share of problems!  The
internal regulator was bad since running it on 12 volts caused it to get
very hot and blew up one set of internal batteries!  The second one
continues to work very well, even the display doesn't go black sitting in
the car in the hot Texas sun.  THE Magellan always required a long cool
down period before I could see anything.

Just my opinion, there is no comparison!

It's a quite exact interface to GPS.

>NOT TO BE USED FOR NAVAGATION?

It reserves the right to be not quite exact without warning.  Also, it's
probably to release Bob from legal liability should someone navigate
themselves off of a missing bridge using APRS.  Oh well... now accepting
nominations for the 1997 Darwin Award.  -rt

Hello everyone,

As Kent has mentioned I too found the same thing when I unzipped the
Waprs110.zip.
However it just came to me that when I unzipped the new waprs I forgot to
put in the -d switch to create a directory. In there you will find the
labels directory. I assume that the airport list will follow. Once you load
the new waprs bring up the N.J map and you will see all of the exits marked
along the turnpike...

I will have to send Mark a note now if he does not see this , and appologize
for not taking the time to think..

>amirault@tiac.net        "Go Fly A Kite"

If you are confused then take a walk to the nearest train tracks
and listen as a train passes.**  This works better than talking about
the "Red Shift"

For a Unattended stations generally better to just leave a midpoint
145.55 and 144.490

BUT this flight due to the Micro-gravity lab, the shuttle is not in the
usually attitude and people have reported the the signal level is better
after the shuttle passes . So xmit on 144,493,500 Hz.

The shuttle antenna is not like the MIR external antenna but is a loop type
placed in a window to earth side (Velcro or duct tape I guess).

For those of you who either own or are planning to buy a DFjr, I have uploaded two files called dfjr.zip and dfjr.txt to tapr in the upload directory. this is two PCX files of the front and back of a quick reference card that i made for my sunvisor in my pickup. Joe has one included in his DFjr package but it's so small i couldn't read it. If those of you who cannot print or resize a PCX file let me know and i can do other formats also.

> 145.555/144.485 approaching and 145.455/144.495 receding, right?

Sorry folks, I fat fingered this -

145.555/144.485 at acquisition and approach
145.550/144.490 at pass midpoint
145.545/144.495 until los

If you are lucky enough to have a discriminator meter in your rx, you can watch the doppler happen - just remember that the downlink starts above center and moves down in frequency during the pass, the uplink starts below center and moves up.

If you have the CD of maps, there is a file on there called AIRPORT.DAT.

If this file is in the DATA folder, the AIRPORT LIST will work.

This is a feature that has been in MacAPRS since version 1.0, and turns out to be VERY useful. There are also a lot of things, (Both currently implemented, and things to come) that depend on this data base.

(If you don't have the CD, we will be putting the file up on TAPR soon).

Rendered body type: text/plain

you can switch the kpc-3 to use data carrier detect by changing the cd
command from the default of "internal" to "software". that's all there is to
it! now the kpc-3 can be attached to an open squelched rig and will only
respond to digital signals, a much better way to go anyways.
good luck!

01  0850  1250z nothing (someone reported weak packet?)
01  1025  1425z nothing.  Weak pkts then voice reported in Salt Lake City
01  1200  1600z nothing
```

=== snip ===

I too heard strong voice transmissions on the 0720 pass, but was not able
to make contact. Should have jotted down the calls of those who did I guess
for verification but didn't think of it at the time.

On the 0850 pass I also heard a couple of packet bursts and thought this
was my chance but after those opening packets, nothing heard.

I didn't listen to the later passes 'cause I was asleep (work nights).

Hoping for more activity this week, sure would be nice if they would
announce the uplink freq. they are listening on as they fly by, all it

takes is "W5RRR listening 95", what's so hard about that?

You need to have the AIRPORT.DAT file in a directory called DATA, the file
is on our CD-ROM and up on the FTP sites (I think)

Sorry, I forgot to include the airport data file.

It is now posted on both rutugers and TAPR

Instructions

Download the file

create a directory called DATA, place the AIRPORT.DAT file in that
directory and try DISPLAY AIRPORTS and AIRPORT list.

Refer to the web page documentation for the WINDS ALOFT information.

Have fun

Mark

67. Re: [APRSSIG:2532] Signal level from Shuttle?

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Tue, 2 Jul 1996 08:59:16 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <199607021359.IAA14728@solar.cs.tamu.edu>
Rendered body type: text/plain

On this mission, the Shuttle's radio is a Motorola HT (MX-300) detuned for EMI/RFI considerations to 2.5 watts. The antenna i a cavity resonator in one of the forward windows, with a pattern that approximates a 1/4 wave groundplane. Mir uses an external 1/4 wave groundplane, and a 10 or 25 watt radio (I'm not sure which radio's primary right now...)

Of these considerations, by far and away the most significant is the antenna orientation and masking. When the Shuttle's antenna favors you, it's full quieting on a handheld. When the Shuttle's antenna is blocked from you, it's pretty slim pickin's.

73, Gerry

It retried out and the TNC was flushing the buffer to the unproto list.
That's all.  I do not recall what we set RETRY to but it's about 4, based on
many empirical tests on earlier misions.

For what it's worth, APRS will be noted prominantly in my presentation to the GIS/LIS conference on GPS data acquisition of realtime data for GIS 17-21 NOV in Denver. I got the notice of acceptance last week and have gone crazy building the GIS and populating it.

I only THOUGHT I was busy before...

Just a note....From NASA Select TV (Satellite S2, Xpndr 9), Columbia is now in the normal payload bay-to-earth configuration. This means that the entire upper surface of the spacecraft is facing ground. Hopefully signals will now be much stronger! Get ready for the full-quiet signals!

At this writing Columbia is approximatly halfway between the tip of South Africa and the west coast of Austrailia on track for a central U.S. pass....

Message-ID: <199607021510.IAA08858@m1.sprynet.com>
Rendered body type: text/plain

```
In my previous posting I mentioned the track of Columbia for the current orbit.
 On watching the projected ground track display on NASA Select, this pass looks
like this...

Encounter the California coast near LAX, ENE bound.
Peak of orbit near Des Moines and crossing the Atlantic coast somewhere around
Jacksonville, FL.  This should be the best pass of the day for those of us in
the central and southern states.

Pegasus was launched from an L-1011 aircraft near Vandenburg AFB, CA and is now
in orbit!

At 1500 CDT Vice President Gore will announce the winner of the bid for
construction of the X-33 spacecraft which is the next generation of re-usable
orbiters.  The speech will be from JPL...

Columbia crosses over LAX 1048 CDT....Possible WEAK carrier

Columbia over Nevada desert 1050 CDT..Nothing heard...
```

(Orbital track from NASA Screen will take Columbia across
AZ, NM, central TX, LA, Gulf Coast and, finally FL peninsula...)

1051 No signals heard...

1052 No signals heard...

1053 No signals heard...

1054 Columbia over NM/TX...No signals heard...

1055 Weak carrier detected. No audio/packet tones discernable...

1056 Crossing Gulf coast...Packet signals heard!!! Too low in level for decoding...

1057 Over Gulf of Mexico headed toward west tip of Cuba..
Signal lost....Good luck Florida!!!

Did anyone plot me???? I sent beacons and posits every 15 seconds for the duration of this pass....

Rendered body type: text/plain

```
Well finally got my DFjr (After the long wait). I had received one of the
antenna switchers that Joe posted a message about on the sig, but got the
new one delivered to the door the next day. After taking a trip to town
to pickup some additional cables needed i tested it out this morning
(Just the DFjr only). I learned one thing right of the bat, i needed a
better quick reference card. The one Agrelo included with the package
just wasn't bif enough for an old man like me to see (It was just to
small), so the first thing i did was to use Corel Draw and make one the
way i wanted it about 4" x 7" to fit on my sunvisor in the pickup Hi.
Well the test went just great, i tuned to a reapeater frequency and took
a ride around the block and the DFjr didn't have any problem pointing me
in the right direction. I do have to do something with all those wires
tough. By the way for this test i was using an HTX202 and worked just
fine. The antenna system is easy to put together but you do have to be
very carefull with those washers Agrelo uses at each antenna. I assembled
all 4 and then checked them with my ohm meter and found one shorted so i
took that one apart and after re-assembling that antenna it was ok, you
have to be very carefull when doing the assembly work on the antenna
system. Anyway for those of you that can't read that realy fine print on
the quick reference card that Joe send you i uploaded the file in PCX
format to the tapr site called DFJR2.ZIP it has both front and back for
the carr visor card, let me know if you would like something added or
changed on it. Anyway all in all it was fun so far. Now the part that i
always have problems with GPS, TNC, Laptop combination.

85. FM Radio on 121.6 for DFjr

From: Dave Kaplan <dkaplan@pionet.net>
Date: Tue, 2 Jul 1996 15:45:04 -0500
To: aprssig@tapr.org
Message-ID: <9607022045.AA14437@ELWOOD.pionet.net>
Rendered body type: text/plain

Since the DFjr want to see an FM signal I find myself wondering:

1. What will an FM receiver do to a AM ELT (Crash Beacon) signal on 121.6 or 121.5?

2. Where can I find a FM receiver (built up or a kit) that will tune for 121.5/121.6?

I want to use the DFjr in conjunction with APRS to hunt ELT signals with Civil Air Patrol. Now I just need to find a way to attach that antenna set to an airplane!

Dave

Not much new today. No packets detected anywhere. But sometime before the 02 1413 pass, the shuttle maneuvered to payload bay down and during that pass voice contacts were MUCH stronger. Statistics today worsened due to 6 no-activity passes. But there was one good voice pass giving us 13 days of SAREX activity. There have now been 16 voice passes and 16 packet robot passes so far. There are now 25 passes with no activity (not counting the 5 on 22nd), but many of these could be SCHOOL passes.

Dave Kaplan says:

>Since the DFjr want to see an FM signal I find myself wondering:

>1. What will an FM receiver do to a AM ELT (Crash Beacon) signal on 121.6
>or 121.5?

>2. Where can I find a FM receiver (built up or a kit) that will tune for
>121.5/121.6?

>I want to use the DFjr in conjunction with APRS to hunt ELT signals with
>Civil Air Patrol. Now I just need to find a way to attach that antenna set
>to an airplane!

>Dave

Dave:

1. The DFjr makes its own FM from the signal as a consequence of the pseudo rotation of the receiving antenna. This is independent of the modulation on the original signal.

2. Looks like just putting a mixing element between the DFjr antenna and and ordinary amateur 2 meter receiver and injecting a signal of about 25 Mhz would produce a frequency component right in the middle of the 2 meter band. (121.5 Mhz + 25 Mhz = 146.5 Mhz) This signal would carry all the information present in the original signal.

3. Might have to extend the length of the DFjr antenna X arms and the length of the whips to work properly at 121.5 Mhz.

4. Probably need to get Joe Agrelo to comment on all the above suggestions just to be sure!

5. Don't have any suggestions about mounting the antennas on an airplane!

snip---
I have to throw my two-cents worth in here.  I too bought a Meridian XL because it
was the cheapest at the time and came with the power/data cable.  I agree that is
fairly easy with the menu system.

My main gripe is with its seeming inaccuracy in altitude.  I even called the
factory on this one, but got NO satisfaction.  They said it was S.A!  Let me
explain:

When I initialized with my rough coordinates (Lat, Long, Elev and time), the
altitude would seem to stay locked in with some reasonable change, but over a long
time (hours) it would drift considerably.  I would see (standing still with
anywhere from 5 to 8 sat's) elevations change from -900 ft to well over 25,000 ft.
I beg your pardon, 25K'!!!  I don't think so.  Can't blame THAT on S.A!  I
basically gave up on expecting anything reliable from the altitude reading.  Now, I
wish I too, had purchased a Garmin 45.  Oh well...

>   73 Claude
>   K5DTN

We are currently testing an AM man overboard system to be used with the DFjr. Testing will start after the holiday weekend, and then we will try to make a modification to support this feature. How this feature will be implemented is yet to be determined. Please be patient and we will let you know as soon as it's done.

The antenna system is broad banded enough that the X-arms shouldn't need to be lengthened, for example: a very fluent user of the DFjr succesfully DFed a 224MHz signal using the 2 meter array.

Mounting the DFjr antenna array on an airplane! may be the TASK of the century;-) but not impossible, since the fuselage is oval (most likely), you may want to drill a hole through that expensive toy (aircraft) for the center mount of the X-arms and use a longer bolt. But! now the the 4 independant, capacitivley coupled, magnets to ground becomes a major issue, without this! no workey! If you could some how have 4 ground radials pointing downwards instead of the magnets, this would work. If ELT's were at a higher frequency, the antenna array could be significantly smaller.

Well... this is starting to look like the APRS/DFjr SIG, lets try to keep more of this directed to me personaly, so we don't upset too many TAPR/APRS/SIG people. Who knows, maybe we'll have a AGRELO/DFSIG someday! Of coarse, if it directly involves the connection of the DFjr with all the APRS versions, then I think that's ok. The DFjr & APRS support each other, naturaly.

We'll keep you posted on the AMplitude stuff.

> APRSdos REPLY COMMENT: Not one of the "side" windows? THis means it is
> pointed straight up on this mission, right? So most of the energy
> goes striaght out to space?

Except when the Shuttle is on it's back! Then the antenna is pointed down and forward.

My understanding is that much of the time the shuttle is _normally_ on it's back with the payload bay looking down at the Earth; this mission has it "right side up" more often than other missions. Another source says this mission has the Shuttle "swapping ends" more often than in other missions too (i.e. sometimes the nose is pointing in the direction of flight, sometimes the tail).

Now, if they just had a good mag mount..... or how about an EVA to attach one of those thru the glass antennas?! Let's see, at about $50 per antenna mount, I think they could affort to let it burn up during reentry. And if it didn't, think of the advertisement campaign a company could mount!! Hmmm. But of course NASA wouldn't pay off-the-shelf prices, so I guess it would run them about $1,500 per antenna. Well, at that rate they might have to ask everybody to send in a "green stamp" for the QSL card...

Please flame me direct if you didn't see the attempt at humor in the above paragraph.... 8-)

The discussion on QUITE EXACT is interesting. The only thing that would make it not exact would be the map. I believe that you could not really rely on APRS for navigation until you insure that your map is 'exact' within the APRS program.

Bob,

When APRS or APRTrak is Armed in Space Mode, is it triggered by _any_ transmission from W5RRR-1 or only packets _digipeated_ by W5RRR-1. With all the Robot QSO connections going on, could it be that our stations are not getting triggered because we never see any digipeats?

Which version of Corel Draw did you use?  If you can write in version 4 (or 3),
I'd like to get a copy of the .CDR file itself.

If not, could you make a Postscript version available?  That would probably be
more useful than the .PCX version (at least a lot clearer for those of us with
Postscript printers).

Thanks.

The FM receiver will see it as an unmodulated carrier.  It should work just
fine.

> 2.  Where can I find a FM receiver (built up or a kit) that will tune for
> 121.5/121.6?

Some of the recent HTs (and mobile rigs) will tune down to the aircraft band
without any problem.  Some of them go to AM mode; however, some can disable
that switch to AM, leaving the rig in FM.  (I believe the Standard C508 is
like this, and costs less than the DFjr.)

A cheaper possibility is to pick up a crystal controlled scanner at the next
hamfest.  Most "high band" scanners should not have any problem with air band
frequencies.

I don't know if any of the Ramsey kits will go that low.  Their FR-146
receiver is listed for 130-180 MHz; maybe a component swap (or an extra turn
on a coil) will put it into the 120 range.  I've found that if you catch one
of the techs at a hamfest, they'll tell you exactly what you need to do to
modify the kit.  A crystal change in the synthesizer for their 2m transceiver
kit should also do the trick.. and still allow operation on 2m.

Just some ideas...  and getting the antennas put on a CAP plane should be no

The latest version of APRtrak6 is posted for ftp from tapr.org. You will find it in the tapr/SIG/aprssig/files/upload area.

It brings aprtrak up to about the equivalent of aprs76e which many of us are using already on this mission. I will post more about it tomorrow.

A few of you volunteered to beta test it, so that is the purpose of posting it. If it looks good, then I will post it on the AMSAT site...

Hi
In response to Bob's request:
I use my GPS-20 for TAC application with no problems, it locks in after
a few minutes even with not very good visibility (usually 3 or four sats,
3-D or 2-D fix).
It takes a few minutes before the DCD 1pps signal is detected by the
computer (when running Showtime).
Haven't tested it in mobile apps. I will use the LCD display for the latter.

115. Position tracking multiple gliders - what technology?

From: Ian Lewis <Ian.Lewis@cl.cam.ac.uk>
Date: Wed, 03 Jul 1996 13:51:17 +0100
To: aprssig@tapr.org
Message-ID: <E0ubROp-0000n5-00@heaton.cl.cam.ac.uk>
Rendered body type: text/plain

As a new joiner of this SIG (and swamped by the volume...) could someone be kind enough to describe the basics of a simple configuration to track multiple gliders in flight back to a ground-station?

GPS has now become standard for pilots in gliding competitions, and we log the tracks to dataloggers for subsequent analysis for confirmation of the turnpoints being rounded and calculation of the round-trip speed.

It seems likely that we will progress to a radio-based real-time tracking method when that becomes feasible.

We can have 40-50 gliders in a competion, flying at groundspeeds up to 150mph, on tasks taking them 100 miles from the home airfield (and back).

I've seen something of the bits that would go in each glider (GPS + NMEA i/f, KPC-3, radio) but am clueless as to the hardware/software configuration back at base. Would we have to dedicate a frequency to this use, if so how often could we record the position of each glider? For other than spectating use we need a fix every 10 seconds, but this can be buffered up if necessary.

The GPS/KPC-3/radio combination is a bit awkward - can you get this stuff combined into one (cheap) unit?

Eagerly awaiting any advice,
Ian
Glider pilot B21, in Cambridge, England.

Well the pass that just went by (#th one i guess) was sleeping the first two. This one i again used my laptop but changed the Doppler thing hi was very very strong in fact full scale on my Alinco DR130 and i heard packet trough it's whole footprint. I bet someone must have seen me on this pass. I must be having a problem running in space mode on the laptop because i didn't even see one beacon in the H,V,P,A list at all?.

Whoa!!  Don't drill any holes yet!  The FAA (Friendly Aviation Admin!) has
some pretty firm ideas about who and what can be done to a certificated wind
wagon (aircraft)
.  Get together with a licenced A&P mechanic or talk with your local Flight
Standards District Office (FSDO) to find out the proper path.  It can be
done, but must be approved and the airworthiness of the flying machine not
be compromised.

|>     modulation on the original signal.
|>
|>  2. Looks like just putting a mixing element between the DFjr antenna and
|>     and ordinary amateur 2 meter receiver and injecting a signal of about
|>     25 Mhz would produce a frequency component right in the middle of the
2
|>     meter band. (121.5 Mhz + 25 Mhz = 146.5 Mhz) This signal would carry
|>     all the information present in the original signal.
|>
|>  3. Might have to extend the length of the DFjr antenna X arms and the
|>     length of the whips to work properly at 121.5 Mhz.
|>
|>  4. Probably need to get Joe Agrelo to comment on all the above
suggestions
|>     just to be sure!
|>
|>  5. Don't have any suggestions about mounting the antennas on an
airplane!
|>
|>     73 Claude
|>        K5DTN
|
|
|We are currently testing an AM man overboard system to be used with the
DFjr.
|Testing will start after the holiday weekend, and then we will try to make
a
|modification to support this feature. How this feature will be implemented
|is yet to be determined. Please be patient and we will let you know as soon
as
|it's done.
```

```
|
|The antenna system is broad banded enough that the X-arms shouldn't need to
be
|lengthened, for example: a very fluent user of the DFjr succesfully DFed a
|224MHz
|signal using the 2 meter array.
|
|Mounting the DFjr antenna array on an airplane! may be the TASK of the
|century;-)
|but not impossible, since the fuselage is oval (most likely), you may want
to
|drill
|a hole through that expensive toy (aircraft) for the center mount of the
|X-arms and
|use a longer bolt. But! now the the 4 independant, capacitivley coupled,
|magnets to ground
|becomes a major issue, without this! no workey! If you could some how have
4
|ground
|radials pointing downwards instead of the magnets, this would work. If
ELT's
|were
|at a higher frequency, the antenna array could be significantly smaller.
|
|Well... this is starting to look like the APRS/DFjr SIG, lets try to keep
|more of
|this directed to me personaly, so we don't upset too many TAPR/APRS/SIG
|people.
|Who knows, maybe we'll have a AGRELO/DFSIG someday! Of coarse, if it
directly
|involves
|the connection of the DFjr with all the APRS versions, then I think that's
ok.
|The DFjr & APRS support each other, naturaly.
|
|We'll keep you posted on the AMplitude stuff.

Rendered body type: text/plain

I have 3 GPS-20 units from TAPR.

Here are the results. All used the same power supply (5.02 volts)
and antenna (garmin active antenna). When locked, signal
level is 1/2 to 2/3 scale.

1. Locked after about 25 minutes the first time.
    After being off for several days it took over an hour
    to relock.
    After being off for 15 hours it relocked in less than 3 minutes!
    In short, it's inconsistant.

2. Initial lock took over 2 hours.
    After being off overnight it locked in less than 2 minutes.

3. Never got initial lock after 15 hours. No signal from any satelite.

Do these things have any controls to tweek?

To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960703094739.14732E-100000@arctic>
Rendered body type: text/plain

Packets really popping this morning! (3 July). Apparently the new shuttle
orientation since midday yesterday has improved performance.
Overall packet statistics were improved by todays passes giving us 14
days of SAREX activity, 17 voice passes and 19 packet passes. There are
now 25 passes with no activity (not counting the 5 on 22nd and any SCHOOL
passes). Eight APRS stations have been successful (15 pkts). Email shows
the seven APRS stations are trying every pass: WA8INZ,WB6LLO,KB0UZQ,KD4EMI
N2THO,WB4APR,KC5EJK. Other stations catching passes when they can are
N3MNT,N3IVO,N8EDU,AD4BL,N2QAE,WA1LOU,KC7CO,N1CPE,WB5QLD,K1HJC,KE6AFE,KU0G
WB4LTF,N5RKN,KC4NHB,AB5GE. Comparing our success rate 15 pkts (for 23
people) to 1100 QSO#s could imply 1700 packet stations worldwide trying
conventional SAREX. All things being equal, that sounds about right? If
you have other data or are not listed, pse report.

128. WinAPRS 1.1.0 Impressions

From: schiers@ames.net
Date: Wed, 03 Jul 96 08:05:56 -0500
To: aprssig@tapr.org
Cc: winaprs@tapr.org
Message-ID: <199607031507.KAA18774@tapr.org>
Rendered body type: text/plain

Below follow my impressions/bugs/features not implemented yet for WinAPRS 1.1.0:

Caveat: this is not all-inclusive, merely things that have jumped out at me as I have used the program since its first beta. These are OPINIONS based on my use of the program. As with any opinion, with it and a quarter you can still get a cup of coffee.

Things I like:

1. The presentation of information is outstanding. Clear, easy to understand.
   (Maps and Lists), easy to manipulate. The program has a very "uncluttered"
   look to it. The program is very easy to "learn"...little to remember at this point.

2. The windowed approach contributes greatly to #1 above.

3. Support for the U-2000 works, without any funny stuff like trying to turn off
   FIFO (buffered uarts) . It does not appear to be hardware dependent.

4. All I/O functions are smooth. I have never seen an I/O error, glitch, over-run,
   etc.....ever.

5. Under Win95 it multi-tasks very well with other high demand programs, i.e.,

multi-media.

6. The "potential features" are very impressive. Their current state is not.

7. Dual port gateway function is really slick with a DSP-2232, (with the noted exception of VHF auto transmissions described below).

8. CD ROM callbook support is a real plus.

9. The vast majority of the things it currently does, it does very well, and in a way that I find comfortable, pleasing, informative and intuitive.

Basic Features Not Yet Implemented or Features that don't work properly:

1. Time out for graying and deletion of stations (nothing ever disappears from the lists).

2. In dual port mode, no auto-transmit of any information on VHF. No positions, no weather, no I.D....in other words, if left unattended, the vhf port transmits nothing about the source station on a timed or automatic basis. The only way to get info out is to force a transmission from the drop down menu. HF timed automatic transmission works perfectly. Since I am at work all day, this means I make no transmissions on VHF from 7:00 a.m. until 4:00 p.m....other than gateway transmissions from HF, a very significant limitation.

3. Rain amounts for both R and P do not reset on the hour and day...they are just total accumulation from last program start. They both read the same at all times.

4. There is no bulletin alert....it is just "another" message in the list, but in Blue.

5. There appears to be a "message to me" alert, but it only works sporadically.

6. Logging: lots of things don't work, i.e., NMEA logging, Weather logging, etc. The only logging that works for me is full APRS logging.

7. File Save command appears to do nothing.

8. With sufficient dorking around, it is still not too hard to make the program crash, either itself, or at times, even the operating shell (Win95).

9. There are many things that do not yet work right or are not present as compared to the "basic" set of features in dosAPRS

10. There is no support for Relative Humidity ...the field is missing. (I have the sensor operating properly).

11. Single station tracking/replay is not present.

Summary:

0. WinAPRS has a wonderful start and virtually unlimited potential. But it has "just started". In no way is it a "ready" product.

1. The current feature set in WinAPRS 1.1.0 cannot be even remotely compared to dosAPRS.

2. WinAPRS has the overall feel of a beta. Too many basic features one expects from vanilla APRS are either missing or don't work right. It is a "work in progress" or "developmental" work. My personal opinion is that it is not at "release" level at this time. This is NOT a

criticism, it is a descriptor. Nor am I saying that it shouldn't have been released. I am simply saying that out of the hundreds of "shareware" programs I have used for dos, os/2 and windows, WinAPRS is in the least developed state of any program that I have ever "paid" for.

3. Bug fixes and basic feature implementation have been slow.

4. I know there are lots of good reasons for this, BUT, someone needs to say these things, and since I anticipate being flamed for some of my observations (which could be in error), I am going to say this stuff anyway. The Bros. Sproul are:

 a. Really nice guys.
 b. Very likely not to acknowledge email, esp. bug reports. (they do keep them and maintain a list)
 c. Very busy.
 d. Available by phone....sounds crazy, but it's true...I feel sorry for them.
 e. Have not made an effective effort to keep their "customer base" informed about program development, future updates, known bugs....even to the point of messages on this list being circulated about their "kidnapping". While tongue in cheek....the point has merit.

Am I glad I registered it? You bet!

Do I run the program? 24 hrs/day.

Do I enjoy using the program? Absolutely.

Would I recommend it to others?

Conditionally. If you need all the "basic" features of vanilla APRS, I would not recommend it. The lack of gray out/deletion based on when last heard is a major problem. The lack of proper updating of the rain amounts makes any "real" use for weather problematic. If you are not concerned about the two items above and just want something that has an excellent look and feel with potential for incredible development, that runs beautifully in a multi-tasking environment then you are in for a treat!

Without doing a full comparison of dosAPRS with WinAPRS, I would make the following observations:

There is no way to fairly compare the two programs. In it's current state of development, I would regard WinAPRS as, at best, APRS-lite. dosAPRS is a mature product that continues to develop, but with its own set of limitations, i.e., mediocre I/O, hardware dependencies, a cluttered appearance and feature laden to the point of intimidation. It has so many features and levels of features that it is difficult to organize and remember. The learning curve for dosAPRS is steep, for WinAPRS it is shallow...but given the relative number of features currently available, the only thing I would say is that presentation of features in a windowed environment always has the potential to be much more user friendly than in a "text" based environment. It should also be noted that the hardware requirements for WinAPRS are far greater than that required of dosAPRS.

WinAPRS is in its infancy and has a very long way to go before it can be considered to be anything more than a precursor to what APRS's basic functions allow it to be. While there are some very advanced functions built into WinAPRS (winds aloft, airport locations, advanced labelling), the lack of implementation of some of the essential "basic" features is a real drawback.

If I have made any mistakes in my descriptions, assessments, etc. please forgive me and feel free to point them out. I am a registered user of both dosAPRS and WinAPRS.

> we need a fix every 10 seconds, but this can be buffered.

ANSWER: Using the slotted assignments of the KPC-3, and allowing 2 seconds
per position report, you would need 100 seconds for 50 gliders.  (With good
solid state TR radios, you could probably assign every second and set
each of 60 aircraft to once a minute, but this would take careful
design and every aircraft would have to use an assigned time slot.  If
you went with random transmits then you would need to make the rate about
once every 4 minutes for a reasonable success rate.
Going to 9600 baud would not help much, since the slot assignments are
only to the nearest second.  I think PacComm has a way to assign sub
second time slots but they have not announced it.  If so, you should
be able to get down to probably a 15 second update rate for 60 units.

> The GPS/KPC-3/radio combination is a bit awkward - can you get this stuff
> combined into one (cheap) unit?

APRSdos REPLY COMMENT: PacComm makes an all-in one unit that includes the
TNC, GPS and RADIO all in one!

Here is KB0UZQ's confirmation.  Now any body see KG0DW?
de wb4apr@amsat.org

---------- Forwarded message ----------
Date: 03 Jul 96 10:50:09 EDT
From: Stephen A. Davis <75076.675@CompuServe.COM>

Well, I think I had success with SAREX here in Des Moines [EN30co] !!  I came up
to my machine this morning to attend the 07:38 AM CDT pass of the shuttle, but
found already on my monitor the following message (machine was set up for
unattended operation while I slept)(using v7.6e) :
CONGRADS YOUR PACKET WAS DIGIPEATED! EVERYONE ELSE SHOULD SEE YOU TOO!
I pressed the 'A' key, but no entries; pressed 'L' and saw:

KG0DW 010922 @010922/Hello COLUMBIA from Steve in Des Moines!  <<<my beacon
W5RRR-1 030608 #953-is your STS-78 SAREX QSO number.   <<<Why was this in the
Latest Beacon list??

APR COMMENT: *** Because that was the latest packet heard from W5RRR-1 *****

BUT, when I press 'V' for the View buffer I got:

W5RRR-1>WB4FIN:#901-is your STS-78 SAREX QSO number.   *** the 0935z pass
W5RRR-1>W4JXM:#952-is your STS-78 SAREX QSO number.    *** the 1107z pass
W5RRR-1>KB5JRA:#953-is your STS-78 SAREX QSO number.
KB0UZQ>EMZ9QJ,W5RRR-1*:

BTW, maybe a bug in v76e space mode: I had activated the LOG under the 'C' key,
and then did a Files-Save- for a backup, but when I tried to replay from the
bakup (using Files-Replay, then name of bk file) my computer locked up....
Since it locked up before I left the program, I've lost my other logs!
{Lucky I wrote this other stuff down before I tried to get fancy!}.

Anyhow, do I now look for a QSO or a QRZ listing of my call somewhere (and
WHERE), or I have done it as far as APRS/SAREX is concerned by getting
Digipeated??  Let me know as I am new to this space talk stuff...

APR REPLY:  You have to wait for someone to report capturing your packet.
```

```
You will not get a copy unless you saw it on the VIEW screen live.  But
the Congrats message tells you that APRS saw it!
```

I'm glad to help! Once you've hanged yourself in all those wires (I built
a fiberglass junction box) and gotten the machines to talk "at" each
other, the fun begins!

First delete the ????.apr file in your root directory and boot APRS. By
deleting that file you'll have to re-enter all your id, port, and
verification info.....BUT this also gives ya a clean slate to start on. Do
all that, and then hit <ALT-S> (D)f df(J)r.......then <ALT-S> (G)ps
(S)pm.....then....<ALT-S> (S)ave..... I think all that is right. Anyway
your reseting the coinfig to Single port mode on account of the Multi-Port
adapter from Agrelo Eng. and your setting the DFjr.
```

NOW......then GPS rate is set thru your DFjr....menu 4?? I think. (Look at your BIG card) I set mine to 15 secs. That gives me a good rate as I travel and *just* enuf for a good map.

UNDERSTAND that the DFjr must be on for GPS data to flow EVEN it your not DFing at the time.

AS FAR AS the other stuff is concerned, i.e. FLAMES....... a little LESS ATTITUDE and MORE LISTENING and maybe your mailbox would stay COOL!!!!

I'll be around for more info giving if'n ya need it!

>>>>>> clip <<<<<<<
Now, if they just had a good mag mount..... or how about an EVA to attach one of those thru the glass antennas?! Let's see, at about $50 per antenna mount, I think they could affort to let it burn up during reentry. And if it didn't, think of the advertisement campaign a company could mount!! Hmmm. But of course NASA wouldn't pay off-the-shelf prices, so I guess it would run them about $1,500 per antenna. Well, at that rate they might have to ask everybody to send in a "green stamp" for the QSL card...

Please flame me direct if you didn't see the attempt at humor in the above paragraph.... 8-)

APRS/STS-78 peers,

Here's (some) of the information from the passes I got this AM.

I got my third "CONGRATS!!!..." message on the 0435CDT pass.
(Did *ANYBODY* "see" me?  Please, oh please, oh please?)

```
(H)eard Log:  (this info upto 11:30CDT from earlier passes)
12 @ 7
2  @ 6
8  @ 4

(V)iew:  (this info upto 11:30CDT from earlier passes)
W5RRR-1>W9HAD:#1017-IS YOUR STS-78 SAREX QSO NUMBER.
W5RRR-1>KB5RZY:#1018-IS YOUR STS-78 SAREX QSO NUMBER.
W5RRR-1>KB5RZY:#1018-IS YOUR STS-78 SAREX QSO NUMBER.
W5RRR-1>SAREX:#1017-IS YOUR STS-78 SAREX QSO NUMBER.

(D)igipeaters used: (this info from 06305CDT)
*W5RRR-1  >KC5EIB

(L)atest Bcns: (this info from 06305CDT)
030607 #948-IS YOUR STS-78 SAREX QSO NUMBER.
```

I did NOT record on paper all the "transient" info (V,A,D, etc, etc...) after the 0430CDT pass, but I DID do a (F)ile, (S)ave. That one woke me from a very sound sleep when the PC "beeped" to let me know I'd digipeated. (I was groggy enough that it took a few seconds to remember why is was standing in front of the APRS station...)I'll be able to (F)ile, (L)oad when I get home tonight and see what additional information I can provide.

Hi Scott & Bill,

Correct! but don't forget you can turn the DF port off, and run GPS *only* if so desired. The display will still show bearings, but now if you see something you like on the DFjr display, press MENU, then ENTER, walla! a GPS POSIT then DF report gets sent to APRS, over riding the DF PORT OFF feature.

Like this:

```
$GPRMC,194616,A,4306.37,N,07448.67,W,000.0,360.0,010396,013.9,W*73
%279/8
```

Have a great, safe weekend guys, and happy APRS/DFjr'ing.
I'm out of here!

Per request i uploaded a new DFjr quick reference card file. On this one
i cleaned up the text around the circle of LED's a little. The file is in
the following formats now, EPS, PCX, TIF. By the way had 2 laminated this
morning with some heavy plastic (Ended up being .030) for only $2.00 for
two on a page. Just right for my sunvisor pocket, they are 4.5" x 8".

Question for Joe, i noticed to calibrate to 0 you must press the
Menu,Sub,Enter keys all at once is that right?.

Yup! don't need to press to hard either. Press and hold MENU,
then press and hold SUB, then press ENTER, release all!. This will ensure
a clean three button press transition, even though there are debouncing
enhancments to the code as well as hardware caps.

The buttons are Panasonic Soft touch (R) and only require 100 grams of force.

Bill, I noticed you used a comma (I think) for the Increment degree value,
symbol on the reference card you posted. Here is the degree symbol °, copy & past
it, if you need it.:-)

142. Map ratios in MacAPRS

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Wed, 3 Jul 1996 15:22:22 -0500
To: aprssig@tapr.org
Message-ID: <v02140b00ae0081b20ed8@[204.251.33.23]>
Rendered body type: text/plain

A square area on the screen (equal number of pixels horiz. and vert.) for
the 100K USGS derived maps describe a rectangle on the ground with the
vert. to horiz. ratio of 1.15 (i.e., not square).

This causes circles to be ellipses. Even the USA map appears squished
(excuse the technical jargon) vertically.

Is this

1. A programming error in the display software?
2. A programming error in the map construction?
3. Something else?

Rendered body type: text/plain

I posted a file called ATI.zip on the tapr site in the upload directory that
contains an 4.5 mile map of Fond du Lac Wisconsin and a 128 mile map of
Ecuador south america.   There are two other maps whcih contain slight
mods due to the new detail in those 2 maps. SO there is a new SAnorth.map
and a new WIMlwkee.map as well. I have no room to include these in
standard distribution. Is W9LZQ in Onalaska still here on the SIG and
can add this and the new WIwest.map to his distributions?

The company ATI wants to put up a digi in Fond du Lac and wants to find
any HAMS in the area...

If W9LZQ is not on the SIG, does anyone see him on their APRS map and can
inform him?

This is a "FEATURE", it makes the math of map calculation MUCH MUCH easier. This was a specific design criteria and we did know that this would happen when we made the decission to do it this way.

The calculations for the map screen x,y pairs and the object screen x,y pairs goes thru the same "squaring", therefore everything still registers properly.

On slower computers it is VERY important to keep it this way. With newer higher speed machines we have been discussing some rather elaborate options but have not started implementing them yet.

In the mean time the circles arent perfect (unless you are at or near the equator)

Mark

I wonder if your using a laptop and getting the squished map?. If so i went trough that a couple of years ago and had to take 2 laptops back till i wised up and took a disk with me that had APRS on it.

Yes Joe i was aware of that but CorelDraw does not have a symbol for that, or at
least i haven't found it hi. I will look again and if i find it i will correct
that Hi. Is everything else correct?.

This is a consequence of trying to depict a (roughly) spherical surface
on a flat surface (in this case a computer screen). All maps and charts
suffer from distortion. The manner in which the surface is depicted on a
map is called the projection, and many different projections that have
been used over the history of cartography. Each has advantages and
disadvantages that make it suitable for certain uses. MacAPRS, like many
low end computer programs, uses a linear projection, where a degree of
longitude is the same distance regardless of the lattitude. (In reality,
of course, a degree of longitude varies from infitesimally small at the
poles, to about 60 nmi at the equator.) The major advantage of a simple
projection like this is computation speed. Given the x,y coords of a
mouse click, one simple needs to multiply by a scale factor and add an
offest to get the lat/lon. Other projections require the use of complex
spherical trig formulas. (i.e. don't try this on your PC AT!) The linear
projection has its major distortion at the poles, none at the equator,
and is not too bad for the middle lattitudes where most of us live.

in Mundelein Ill  VE2KAD Jean-F in Rawdon Quebec FN36CB
------------
APR COMMENT: We have many digipeaters in SPACE.  If you are frustrated
with trying to work the shuttle when most of the time it is not in packet
mode, consider that a simple mod to most standard TNC's will put you and
your 2mFM RIG on several PACSAT uplinks!  THen we could play mobile
position reporting for real!  All the time!

I have been told that all you have to do is XOR the TNC data with the
1200 HZ clock and plug that into the MIC jack!  We need someone to get
excited about this mod, figure out how to do it, and enlighten us!

Any volunteer wanna take this on?  I know most of us dont have time, but
surely someone does...

I was trying to setup APRS with the DFjr using the MPA and what i was
wondering it still has the window in the upper right corner asking to move
the cursor to your qth then press I-M position. Is that going to be there
all the time even when running mobil?, or did i do something wrong. I
didn't have a GPS hooked to it yet. I got the following string but it was
in the HOST directory only.

WA8INZ-14 032011 @31954/0000.00N/0000.00W/newuser/303/108/DFjr

Also why does it show the newuser when i entered a validation number for
the DF,GPS

W1 and W6 (the 2 usual SAREX windows) are the aft-most windows next to the
pilot and CDR on the forward flight deck.  W7, W8 was tried for STS-50 and
while we had a lot of QSOs, VSWR was hign and impossible to correct in that
installation.

APRSdos REPLY COMMENT:  THe aspect ratio is not constant.  It varies with
latitude.  You dont notice this at most scales, but it is very noticable
with the USA or WORLD maps.  I vary the aspect ratio of the screen
proportional to the latitude of the CENTER point.  Center yoru screen on
IOWA and see how the USA width is different then if you center it on
Texas.  THis was done to elminate the distortion of a Mercator Map
when displayed on a flat screen as you move north...

Re: the posting a day or so ago on updating element sets:

According to Gil Carman, WA5NOM, the STS-78 flight vector at about
1100 UTC this morning showed that the actual pass times are running
2.0 seconds later than predictions from element set #913 issued
yesterday, so #913 is still good through today.

For those who are using Gil's TLEs see previous SAREX Bulletin #2 :

>SB SAREX @ AMSAT $STS-78.002
>STS-78 SAREX Mission Begins
>
>Silver Spring, Maryland  USA
>June 20, 1996 @ 20:00 UTC
>...
>At this time, there are no trim burns planned from Rev 4 until the deorbit
>burn, so the Spacelab mission orbit should be fairly stable.  However, this
>is a fairly low altitude flight (146 x 150 n.mi., decaying to 138 x 149 by
>deorbit), so the drag values will be higher than a 190 n.mi. orbit and
```

```
>increasing.  This means that new orbital elements will be sent out no more
>than once a day by the SAREX Working Group.  A day will be skipped if it
>looks like the previous set is still good to within 10 seconds.
>...

Also SAREX Bulletin #15:

>SB SAREX @ AMSAT $STS-78.015
>STS-78 SAREX Update and Keps 15
>
>Silver Spring, Maryland USA
>June 26, 1996 @ 23:00 UTC
>...
>AMSAT member Gil Carman, WA5NOM, reports that it's important on this
>flight to keep updated to the latest elements.  Even though there are
>no orbit adjust burns, the low altitude and the attitude changes
>between tail down and tail forward make the drag variations very
>significant.
>
>For example, element set #909 is 5 seconds later than set #908 now,
>and will be 14 seconds later by this time tomorrow.  Ten seconds is
>about the maximum allowable tracking error for a high elevation
>pass on orbits this low in altitude to keep [the orbiter] in a 35
>degree (e.g., KLM-22C main lobe) antenna pattern.  Of course,
>amateurs who use a lower gain antenna need not be concerned as
>much.
>
>The orbiter is rising EARLIER than earlier element sets predict,
>by a matter of minutes from the prelaunch set.
>

Hope this helps some.  We'll check again tomorrow morning.

Good luck to all,

Pat WD8LAQ
SAREX Volunteer

APRSdos REPLY COMMENT: This report is confusing.  THe DIGIS page does not
show times. THis is not a packet from the D page. It does not
indicate if the packet was heard direct or via W5RRR-1
Can any one confirm if this was a valid digipeat?

OK, OK... I *can* see the humopr, but I just gotta respond :-)

Mark L. Bary sez:
>
> Except when the Shuttle is on it's back! Then the antenna is pointed
> down and forward.

Which turns out to be a pretty near optimal orientation for RF emmissions toward the earth.

The antenna's patern is best described as a torus of nearly unity gain at the maximal widths of the torus, with a half-cone angle of about 85 degrees and a half-cone of virtual exclusion of about 5 degrees. This ignores the angle of takeoff of the torus of about 7.5 degrees at the feedpoint, generally caused by its cavity nature. Oh, yes... This sounds an awful lot like a 1/4 wave ground plane.

> My understanding is that much of the time the shuttle is _normally_ on
> it's back with the payload bay looking down at the Earth; this mission
> has it "right side up" more often than other missions. Another source
> says this mission has the Shuttle "swapping ends" more often than in
> other missions too (i.e. sometimes the nose is pointing in the direction
> of flight, sometimes the tail).

One-wng-low is not unusual for missions with significant pointing requirements. One of our nightmares earlier in the program was trying to determine attitudes from the Attitude TimeLine (ATL) before the FAO folks started helping with that. WA5NOM and I spent a lot fo modelling and database time attempting to determine the best window for ops. And for those of you who understand the Right Hand Rule of spacecraft attitudes, more'n once, Gil and I really could have used splints after a long ATL interpretation session.

> Now, if they just had a good mag mount..... or how about an EVA to attach
> one of those thru the glass antennas?! Let's see, at about $50 per
> antenna mount, I think they could affort to let it burn up during
> reentry. And if it didn't, think of the advertisement campaign a company
> could mount!! Hmmm. But of course NASA wouldn't pay off-the-shelf
> prices, so I guess it would run them about $1,500 per antenna. Well, at
> that rate they might have to ask everybody to send in a "green stamp" for
> the QSL card...

the glass is too thick! We investigated the Thru-the-Glass technology a couple of years ago several times, to make sure we didn't miss something. It *can* be done, but it's more efficient to send the AF out by laser, decode taht and then transmit it. Oh, and we considered THAT once too.

The most promising option, IF they were'nt winding down the Spacelab module program, is to use a SAFEX-like antenna on the aft endcone vent plate, and incorporate that as a programmatic engineering change. Then, it's normally there, but if someone has a requirement for that vent plate, it's an added cost and impact to the design for them to use it!

Oh, yes... nothing magnetic to stick the mag-mount to.... darn it!

> Please flame me direct if you didn't see the attempt at humor in the
> above paragraph.... 8-)
OK!

164. APRS Sarex report (12)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 3 Jul 1996 23:58:51 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960703122959.23519G-100000-100000@arctic>
Rendered body type: text/plain

More data came in for 3 July so here it is again updated. Packets really popping this morning! (3 July). Apparently the new shuttle orientation since midday yesterday has improved performance. Overall packet statistics were improved by todays passes giving us 14 days of SAREX activity, 17 voice passes and 19 packet passes. There are now 25 passes with no activity (not counting the 5 on 22nd and any SCHOOL passes).

Eight APRS stations have been successful (20 pkts). Email shows that seven APRS stations are trying every pass: WA8INZ,WB6LLO,KB0UZQ,KD4EMI N2THO,WB4APR,KC5EJK. Other stations catching passes when they can are N3MNT,N3IVO,N8EDU,AD4BL,N2QAE,WA1LOU,KC7CO,N1CPE,WB5QLD,K1HJC,KE6AFE,KU0G WB4LTF,N5RKN,KC4NHB,AB5GE,KG0DW,KD1SM,N1JDU,KF4DYS,KK6IB,N6HNY. Comparing our success rate 20 pkts (for 29 people) to 1100 QSO#s could imply 1700 packet stations worldwide trying conventional SAREX, all things being equal. That sounds about right? If you have other data or are not listed, pse report.

APRSdos REPLY COMMENT: Ger, this is still meaningless to me.  There are
two windows forward, and two to the sides of the "windshield" areent there?
Then there are two little windows that are the aft-most looking into the
payload bay.  Which ones are you talking about as being the aft most?

Most of us dont know where the "forward flight deck" ends and what ever
else begins.

Are these two windows the ones facing mostly sideways?  Put the answer in
laymans terms relative to the most casual observer, hi hi  Thanks.

Hi APRSers!

I've uploaded WXHURR1.ZIP and .TXT to tapr/SIG/aprssig/files/upload

This APRS utility reads the marine tropical storm warnings from the National
Hurricane Center and creates an APRS backup file, which can then be loaded
into APRS. It plots both the storms position and max radius of storm winds
and the projected track. It is based on WB4APR's NWSPARSE.BAS, but highly
modified.

The executable and source code are included, as well as some short
instructions with the Internet address to retrieve the warnings. Also, I
included one of the Boris warnings so you can see how it works.

It was debugged on TS Boris warnings. Boris hit the west coast of Mexico last
weekend.

If there are any minor changes to the marine tropical advisory format, it
will have to be modified - I tried to cover all the situations I've seen so
far.

Hope this is of some use this Hurricane season.

Ya, BUT at least the windows ARE on the EARTH side of the spacecraft in a
leading position to the path of the orbit. This places the antenna perpendicular
to the surface of the earth with the best radiation pattern to be in the forward
direction of the orbit.  Stands to reason then that signals will be better on
APPROACH rather than departure...

Well i made the 3th pass for this morning and seen many confermations but
i still can't save them or even look at them once i hit the spacebar. I
did get two CONGRATS messages and something i didn't notice before the
upper right window said Mode is set to success. Also there was a message
in one of the STS-78 beacons wishing everyone a happy 4th of July. i
heard STS-78 24 times on thes pass.

    APRSdos REPLY COMMENT: This report is confusing.  THe DIGIS page does not
    show times.

You are right.  Earlier today I sent you a full report showing
exactly what's on my Latest beacons page.  It verifies the
reception of N1JDU's report via W5RRR-1.  I apologize for
trying to use an abbreviated format for my initial reception
report.  I'll transcribe more clearly next time.

(And I confirm N1JDU's previous report of hearing the digipeat of
WB4LTF EL98IP at 1246z yesterday, as I also included to Bob in
this morning's mail.)

We are putting up remote wx stations using the U-II and KPC-3's. What is needed to connect the tnc to the wx station? Is the pc data logging cable that Pete Bros. sells the proper cable for the job? Or is something else needed???

Thanks...

kt4ll

Sure would like to have control over the xmit timer feature when in SPACE mode in APRTRAK.06. Its a good idea if all other stations trying to uplink used Aprtrak but a major disadvantage going up against users with terminal pgms and tncs set very aggressive. Good feature for unattended operation in AUTO-SPACE mode.

Hi All,

Well I finally downloaded aprtrak6 last night and fired it up. I set my
kenwood up
on the right offset. When I got up this am there were two confirms on my screen.

w5rrr-1>wd4kpg:#1170-is your STS-78 SAREX QSO number

w5rrr-1>n4mio:#1171-is your STS-78 SAREX QSO number

I also heard some voice above our hydro line noise here. I figured that is
prety good for our location way up here in the Muskoka's of Ontario, Canada...

Best of luck everyone...et 73

APRSdos REPLY COMMENT:  There are 3 ways to control your TRANSMISSION
using APRS or APRtrak:

1) If in SPACE (or AUTOspace for 0.6) then your BEACON timer will be
reset as soon as your station hears the 1st packet *FROM* W5RRR-1

2) You may force your BEACON at any time by hitting the XMT-BEACON cmd

3) You can also reset your own BEACON timer by re-entering your BEACON.
Simply hit alt-B and type your very brief BText again.

For SAREX all we want are BEACONS, since they contain your GRID Square
posit in the shortest possible format..

APRSdos REPLY COMMENT: Thanks for the report!  If you see someone on your
map, then that is proof of an APRS contact.  If you see QSO#'s, then
those are all of the other stations using conventional CONNECT requests
to the shuttle.  We are only tracking those numbers for curiosity, they
are unrelated to APRS...  Thanks.

183. APRS Sarex report (13)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 4 Jul 1996 11:23:37 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960704102028.12724I@arctic>
Rendered body type: text/plain

Great day for packet on the 4th of july! Overall packet statistics were improved by todays passes giving us 15 days of SAREX activity, 18 voice passes and 22 packet passes. There are now 25 passes with no activity (not counting the 5 on 22nd and any SCHOOL passes).

Ten APRS stations have been successful (37 pkts). Email shows that eight APRS stations are trying every pass: WA8INZ,WB6LLO,KB0UZQ,KD4EMI N2THO,WB4APR,KC5EJK,AD4BL. Other stations doing passes when they can are N3MNT,N3IVO,N8EDU,AD4BL,N2QAE,WA1LOU,KC7CO,N1CPE,WB5QLD,K1HJC,KE6AFE,KU0G WB4LTF,N5RKN,KC4NHB,AB5GE,KG0DW,KD1SM,N1JDU,KF4DYS,KK6IB,N6HNY,WA4HEI. Comparing our success rate 37 pkts (for 30 people) to 1170 QSO#s could imply a lower bound of 1500 or upper bound of 3500 packet stations worldwide trying conventional SAREX, all things being equal. Does that sound about right? If you have other data or are not listed, pse report.

04  0834  1235z Nothing heard in MD (but Im suspect my ant is marginal)
04  1000  1400z Heard carrier bursts with doppler, but no voice?
```

Still need someone who saw KE6AFE APRS packets back on the 29th.
I still have three passes unaccounted for.. If you have raw data to fill
in or correct entries above, please send them to me. I also like to get
the QSO#'s for every packet pass (just 1st and last # pse)

SOAPBOX: OK, we are finally getting some good data, but we need to keep our
excitement limited to only the minimum necessary to accomplish the
goal... That is: A position and status on the APRtrak map.

1) there is no need to hit more than one POSIT per pass (maybe 2, one at
beginning and one at end to cover both geographical areas of the pass).

2) Text that includes your city, location, grid square, or callsign is
just wasted channel capacity since the APRtrak format already includes
ALL of that! Of all the status TEXT seen above, the only "info" that
does not fall into that category is your name. hi hi

Im not trying to dictate what your "status" is, but just suggesting that
you omit redundant info..

There will be 3 more passes today for the west coast, but I am sending
this out now, since I will be busy the rest of the day.

Sorry.  Once again I messed up by trying to respond when I was too tired to be
coherent.

There are 6 windows on the forward flight deck and 4 on the aft flight deck.
If you are facing the node of the Orbiter, looking at her from the front, the
two "windshield" windows are W3 and W4.  Prime viewing ports, and required to
be open or easily cleared, these are only covered with soft window shades for
crew sleep times.  Immediately to either side of W3 and W4 are W2 (on your
right) and W5 on the left.  These are more at an angle than "head-on."
Proceeding further, the two "side" windows are W1 (on your right) and W6 (on
your left).  Smaller, harder to get to for Earth Obs operations, these are the
2 principle SAREX windows.  The standard antenna mounting plate was designed

to fit these, although the W7-W8 overhead windows in the aft FD also have a
mounting plate... which is too small for a good ground plane.  Of note: For
STS-35, although the W1 and W6 windows were deemed unusable for photo
opportunities, Ron Parise, WA4SIR, convinced us to put 2 holes in the plate
large enough to shoot a 100mm 35-mm camera lense through in case the need
arose to photograph something "right now, through THAT window."  Proved to be
inspired foresight.  Also, it gave us a good handhold to grab the plate for
emplacement and removal.

> Most of us dont know where the "forward flight deck" ends and what ever
> else begins.

The "forward Flight Deck is the crew area where the activities of piloting the
craft occur. This is where the Pilot (PLT) and Commander (CDR) sit for ascent
and entry, and where on-orbit operation of the thrusters can occur.  The Aft
```

Flight Deck is the operations area for On-Orbit operations of experiments, data recorders, the Arm, and the like. It's immediately behind the MS seats (three of them are mounted there for ascent and entry), which are detached and stowed for on-orbit operations at the same time the crew are getting out of the Launch and Entry (partial pressure) suits.

> Are these two windows the ones facing mostly sideways? Put the answer in
> laymans terms relative to the most casual observer, hi hi Thanks.

Yes.

For what it's worth, I learned a lot of this the hard way: Asking the guys, when we were doing SAREX training for a number of years. I did a large part of the training, and we decided that a session in the Shuttle trainers at JSC was important. One thing that fell out of that was my opportunity to become better familiar with their terminology of the hardware on the Vehicle. Another was, I forced them to think early on about where they were going to plug everything in... there's limited number of 28-vDC plugs available on the Flight Deck, and even fewer free usually on the Middecd, the lower level of the Orbiter, where the Crew Hatch and Airlock are located. The Middeck is where WA4SIR operated on STS-35, and found it to be less than ideal. The folks tend to like to look out the windows while they're doing General QSO operations, although if they're talking to a school, they frequently put up the shades and try to configure for TV downlink, if it's available in the datastream and timeline. It's also where the wall of lockers housing everything from SAREX equipment to dinner are kept.

Hope this was a little more responsive.

Message-ID: <1.5.4.16.19960704111312.10bf4140@apex2000.net>
Rendered body type: text/plain

I finally looked to see why I couldn't shell to DOS from APRS. I use JP Software's 4DOS.COM replacement for COMMAND.COM. (why would anyone use anything else?) Everytime I had tried to shell to DOS, APRS crashed and burned.

For some reason, only COMMAND.COM is recognized so I had to created a batch file to execute ARPS after setting COMSPEC=COMMAND.COM

Date: Thu, 4 Jul 1996 12:25:49 PST
To: aprssig@tapr.org
Message-ID: <19960704.122550.2614.3.ad4bl@juno.com>
Rendered body type: text/plain

On the SAREX reoprt 13 which I received I noted this entry:

```
04  0700   1100z  QSO#s  1158-1173

1105z  AD4BL>W5RRR-1*>EM70DF:AD4BL EM70
```

Does this mean that my station connected with the Shuttle or was it just

my beacon?
If it was a contact I would like to know what the QSO# was because my
logs don't
have it.

Rendered body type: text/plain

Didn't have time to write this earlier today due to a little train-ride outing and a visit to N0LRF's house for more antenna parts....

On the 0930 (CDT) pass I heard voice packets but could not make out what was being said. After seeing that VA3CSA was the operator and knowing his French accent accounts for my failure to understand the content. (that and having gotten up every 90 minutes all night to catch passes starting at 0-dark-hundred...)

Will try again tonight after 0400 UTC....Another sleepless night in Kansas City....Hmmmm....wonder if they'll make a movie about ME?!?!?

Best 73,
Jim Duncan, KU0G

Im sharing this with the sig, because Many of us have had this little panic about our boards dying. The thing is, that the power-up-reset circuitry is very picky about how the power is applied. I dont know what the details are, but it appears that the 5 volt supply must be "stiff". FOr battery trackers, you might have a big CAP across the battery to give the stiffness when the ON switch is flipped.

On Thu, 4 Jul 1996, Dr Samuel Guccione wrote:

> Bob, I found that it was the supply. I was operating from a battery and did not check its stiffness. That is when I thought it was not operating correctly. Then I tried one of my power supplies. Guess what! I did not check its stiffness either. Both battery and supply were not stiff enough. I guess I will need two batteries to make my tracker box work.

198. aprs-fl List Server in Operation

From: n2czf@magg.net (Richard Garcia)
Date: Thu, 4 Jul 1996 23:58:24 -0400
To: aprssig@tapr.org
Message-ID: <199607050358.XAA31822@grumpy.magg.net>
Rendered body type: text/plain

Anyone involved with APRS operations in Florida is encouraged to subscribe to our new mailing list. The reason this mailing list has been formed is that a few of us have found out that several APRS users (meaning a lot) have kept away from the aprssig or have unsubscribed due to the volume of mail and the ammount of mail that did not really pertain to them.

APRS-FL is geared to people wo use APRS in Florida or surrounding states and others that are interested in networking or different areas to the NWS and possibly some of the Caribian Islands. If you are one of thse people please sign up so we can start a more orginized group of users and administrators and keep abreast of everything that is happening in the state. A lot goes on that no one knows about due to the large area that we cover and much of that we can all use for ideas and as a learning tool.

If you know of anyone in the state that has unsubscribed from the aprssig or has never joined please let them know so they are aware of our existance. To sign up do the same as you have done for the aprssig send a message to...

listproc@tapr.org

In the body of the message enter the following>>>

subscribe aprs-fl First Name Last Name   (Of course replace that with your real name! hi hi)

The above listserver does NOT MEAN that EVERYTHING should be posted to aprs-fl but ANYTHING pertaining particulary to our region. Use common sense in deciding if a message should go to aprssig@tapr.org or aprs-fl@tapr.org. The APRS Sig still has one of the largest and most knowledgeable group of people that I know of and should be seriously considered for general APRS questions and problems. Remember if aprs-fl get's crazy with mail that is not on topic, whoever we attract that had been on the aprssig but signed off for the same reason will probably do the same. We need to have everyone possible stay in touch somehow so we can get some semblance of orginization together. Our numbers are growing every day now but most areas do not know what the other ones are doing!

Just a question or survey, a neighbor of mine who just recently put together
a tracker for his vehicle for a trip from Chicago, to Dallas, to Phoenix,
and onto Los Anegeles, Seattle and Yellowstone and back to Chicago in 32
days, I am wondering if anyone can recall seeing his station, the reason
were asking is he didnt show up in the network very well, locally, running
only 5 watts and quarte-wave, we are tring to determine if the setup works,
I know there are many people in areas that dont have gates and that is why
anyone can recall a -9 station mobile reporting 15 minutes, please let me
know Privately weather@xnet.com

Thanks

A bug in the Microsoft Exchange Mailer
OR that Damn extra garbage at the end of a message and unreadable
attachments.  AND HOW it FIX it !!!!!

--   INFO From  MACWAY Digest ---

I just had to forward this post which came via a listserv discussion
group, from the list owner, to all the Windows 95 users on the list.

************************************************************************
Thought it might be time to take up some bandwidth with a note to the
WIN95 users on the list. Believe me, this will benefit all of the
subscribers to this list, especially the people on Digest. The
attachment, or some people see it as long uuencoding at the end of the
post, is from a bug in the Microsoft Exchange Mailer in Win95. You will
not see the problem but you will hear about it as it causes major
problems on other mailers.

Exchange uses MIME with it's "RICH TEXT" to compose messages with
different colors and fonts. Blue is the default color when it composes
new messages. Exchange sometimes decides to START telling the whole world
this MUST be read as blue when it sends it out.Turning off the color
doesn't help, it then sends out uuencoding or an attachment telling
everyone" read this in black". If you have exchange then the posts just
come in OK, not with an attachment. Exchange reads its own encoding just
fine!

It will sometimes also add an = sign and sometimes =20 at the end of each
line.

OK now the fix. First turn off the color,Click on TOOLS, OPTIONS and then
```

on both READ and SEND click on FONT and set the color to auto.Then click OK and Apply.

Next click each of the addresses in your address book and making sure the "rich text" box is not checked. If even one is on it will send them ALL in rich text. Add your own address to the address book with rich text not checked.Check it ON then OFF and click apply.

Next click on TOOLS again,OPTIONS, SERVICES and set it to INTERNET MAIL, if you do not have it add it in. Click on PROPERTIES and in GENERAL click on MESSAGE FORMAT. If MIME is on take it off. Then to get rid of the = signs click on CHARACTER SET and switch ISO 8859-1 to US ASCII. If this one is already set, switch it to the first one and click OK, then go back and switch it again to get it to reset. Click on OK, OK, and apply. When it resets you will get a message that it will not take effect until then next time you open exchange. Close Exchange and reopen it.

How to make sure the cure is working!

Right click on the addresses on incoming messages and YOUR address on your posts that you get back from the lists. Bring up properties,see if rich text comes up checked. If not turn it ON and apply, then OFF and apply. It sometimes takes a couple of trys to get it to reset, So check several times to make sure rich text stays off.

Despite all of this you MUST continue when you use "reply to sender" and "forward to" buttons to highlight and double click on the address on the new message and check properties to make sure rich text is turned off, IT WILL TURN on for these functions with a new address and sometimes even with one that was turned off before .Or use "compose new message" and copy and paste the parts of the post you want.

Not as important, Exchange does not add in quote marks ( ) and some people get testy about that. If you want them you can go to this web sight and get a program to add to exchange that will put them in when asked. It still doesn't do it automaticly but is a lot eaisier than putting them in one at a time.The web sight also has lots of help for Win95 problems. <http://www.creativelement.com/win95ann/win95ann5.html#13>

> least i haven't found it hi.

It's a standard Windows symbol. It's <Alt>-0176, which means hold down the Alt key, and type 0176 on the numeric keypad. (It does need the leading zero for some reason.)

Hi Charlie,

TNX for the msg.

>   I have my GPS-20 serial port (pin 4) working into the
>computer. (I can see the NMEA data). I have pin 3 tied to the
>DCD line. I do NOT   have the RX1 pin 5 connected. DO I NEED PIN
>5?

This is my setup:

```
GPS-20         DB-9(RS232)
```

```
pin#            pin#
3 PPS <---------> 1
4 TXD1<---------> 2
5 RXD1<---------> 3
8 GND <---------> 5
10 +5VDC
```

One important observation!!! in my GPS-20 it seems there is
no 1PPS signal before the receiver is fixed, so TAC will not
work till the receiver has fixed. This is a problem if you
power-up the receiver and inmediately want to run Showtime.
I use another program (WinGPS) to check that the GPS is fixed
and reporting a position, then I start Showtime.

A question for the SIG.

Garmin communication program ver A.01.06.04 does not communicate
with my GPS-20, it cannot ident the GPS-20. Any clues?

> I have also down loaded the SHOWTIME distribution (I
>forget what he called it but it is ver.3.30) and a setup D: to
>unzip it to my D drive. I sean to have all the directories and
>files as described in one of the READMEs.

Check that you are using the garmin.gps file instead the
showtime.gps, the later defaults to Motorola receivers.

Hope this helps,

Best 73 de Toni, ea4le

Ok Paul thanks, i already fixed the problem. What i did is just drew a circle
within CorelDraw that i should have done in the first place, but that's good to
know anyway. Thanks again.

Toni:
 The Garmin communication program must see the "Garmin" protocol, not
the NEMA outrut string. The assembled units ie. the Garmin 40, garmin45
etc. have this protocol available in the I/O setup.

> If it was a contact I would like to know what the QSO# was because my
> logs don't
> have it.

This is, indeed, a beacon.  The SAREX TNC cannot tell anything about an APRS
packet, but can digipeat it.

A SAREX contact with the Packet Robot consists of a connect request, ACK'd by
the Robot, a Confirmation number ACK'd by you (or... your TNC) and a DISC sent
by the Robot and ACK'd by you.

Since STS-35, we started relaxing the rules for "QSOs" vice SWL-type hits by
saying that anyone who'd copied their QSO number even without the DISC that
cements the QSO into the WORKED list, was a valid contact.

So, in short, if you're trying for a Packet QSO confirmation, stop sending
APRS packets and simply issue a connect request.  If you're interested in
continuing the APRS experiment, continue digipeating.

218. GPS mapping - Cheap!

From: "Hufford, Kent" <khufford@postmaster2.dot.gov>
Date: Fri, 05 Jul 96 10:44:16 EST
To: aprssig@tapr.org
Message-ID: <9606058365.AA836589309@postmaster2.dot.gov>
Rendered body type: text/plain

Most of you know, you can get "Precision Mapping 2.0" at a computer show for as little as $19. It retails for $39. Has ALL the street level maps for the US on one CD rom.

They have had on their web site "www.justsoftworks.com" a GPS beta version. IT works great with any NEMA output GPS. They just released their retail final version 1.1. IT retails for $59. But you need a copy of 2.0 also. You can download the retail version from there web site, and it will work for 5min. at a pop. CAll them up and give them your plastic number, and they will give you your registration number to make it the full version. Or you can buy Precision Mapping 2.0 w/GPS for $99 retail. They also have the same software w/GARMIN 38 for $399.

Anyway, the maps are great, works great with a GPS, and only costs $78-98. Now all they need to do is add APRS..

Kent

Rendered body type: text/plain

For those of you expecting to see your APRS USA map light up with contacts, I'm sure you are as underwhelmed as I, but remember that the SAREX QSO packets contain no position info. Only when you capture an APRS formatted DIGIpeated positions will they show on the map. I have only seen 2 the whole mission (altohough a total of 56 have been reported)

Clearly its time for me to overhaul my antenna (in the top of an 80 foot tree)

Also notice that there are only 32 of us compared to 1500 to 3500 other packeteers trying, and we are all competing for the same few seconds..

APRSdos REPLY COMMENT: Here are the factors involved in being sure that you have saved everything:

1) You should have LOG enabled (tho it only will auto-log if you get more than 50 packets!)

2) You should do a FILES-SAVE before you exit APRS

OR

3) When you QUIT aprs do *not* accept the default backup file name of "BACKUP". If you use BACKUP, then the LOGS and HSTS files are *not* saved.

4) All packets heard by APRS will be captured, unless you are in O-C-T mode where you are talking to your TNC directly and APRS is disabled.

I saw something unexpected on the 1052Z pass this morning - immediately after
getting the "Success" notification from APRS, Columbia sent a QSO # (which
because of Windows problems which caused APRS to crash shortly thereafter) which
included a long string of callsigns - maybe ten or fifteen of them - thereafter.
Something on this order:

W5RRR-1>QSO# 13XX W1ABC W2DEF W3GHI W4JKL W5MNO W6PQR KC7CO W8STU.....etc.

Since this differs from both the single packet APRS digi and the single QSO
connection confirmation, can someone explain what I've seen?

Thanks!

Most of you know, you can get "Precision Mapping 2.0" at a computer
     show for as little as $19. It retails for $39. Has ALL the street
     level maps for the US on one CD rom.

     They have had on their web site "www.justsoftworks.com" a GPS beta
     version. IT works great with any NEMA output GPS. They just released
     their retail final version 1.1. IT retails for $59. But you need a
     copy of 2.0 also. You can download the retail version from there web
     site, and it will work for 5min. at a pop. CAll them up and give them
     your plastic number, and they will give you your registration number
     to make it the full version. Or you can buy Precision Mapping 2.0
     w/GPS for $99 retail. They also have the same software w/GARMIN 38 for
     $399.

     Anyway, the maps are great, works great with a GPS, and only costs
     $78-98. Now all they need to do is add APRS..

Five more stations got plotted on APRS today giving us 15 days of SAREX activity, 20 voice passes and 25 packet passes. I still need a list of Scheduled School passes so I can account for about 30 passes where we heard nothing...

Twenty APRS stations have been successful (62 pkts). Email shows that nine APRS stations are trying every pass: WA8INZ,WB6LLO,KB0UZQ,KD4EMI N2THO,WB4APR,KC5EJK,AD4BL,KC4ZQ. Other stations doing passes when they can are N3MNT,N3IVO,N8EDU,AD4BL,N2QAE,WA1LOU,KC7CO,N1CPE,WB5QLD,K1HJC, KE6AFE,KU0G WB4LTF,N5RKN,KC4NHB,AB5GE,KG0DW,KD1SM,N1JDU,KF4DYS,KK6IB, N6HNY,WA4HEI,KC4ZGQ,KI5VM,WB3JNZ,N2NRD,VA3HOI.

Comparing our APRS success rate 62 pkts (for 37 people) to the total number of stations playing with SAREX, (1350 QSO#s) could imply a lower bound of 2200 or upper bound of 4200 packet stations on frequency, all things being equal... Does that sound about right?

If you have other data or are not listed, pse report.

I still have three passes unaccounted for.. If you have raw data to fill in or correct entries above, please send them to me. I also like to get the QSO#'s for every packet pass (just 1st and last # pse)

Probably only ONE day to go (and its all at sleep time!). Have fun!

Bob, just a final note to you and the SIG. I have finally got my MIM/MIC tracker box to work. Thanks for your support during my assembly and testing. I did finally use two 2 AH batteries. One for Maxon and one for the GPS-20 and MIM. I will see how well this combo works over this weekend. Will be testing it extensively.

Sam Guccione K3BY near Dover, Delaware

On Thu, 4 Jul 1996, Bob Bruninga wrote:

> Im sharing this with the sig, because Many of us have had this little panic about our boards dying. The thing is, that the power-up-reset circuitry is very picky about how the power is applied. I dont know what the details are, but it appears that the 5 volt supply must be "stiff". FOr battery trackers, you might have a big CAP across the battery to give the stiffness when the ON switch is flipped.
>
> On Thu, 4 Jul 1996, Dr Samuel Guccione wrote:
>
> > Bob, I found that it was the supply. I was operating from a battery and did not check its stiffness. That is when I thought it was not operating correctly. Then I tried one of my power supplies. Guess what! I did not check its stiffness either. Both battery and supply were not stiff enough. I guess I will need two batteries to make my tracker box work.
> >
> > Thanks for the confirmation of the solution. I was worried about toasting $180 board.

Well, I'm REALLY disgusted now! I was in space mode all night long and didn't get squat here! Of course, I slept through the two best passes, but thought I would at least get an auto-hit! Will try again tonight then quit in anger and frustration and look with chagrin on Bill just north of me who, with his puny 50 watts and mag-mount-on-a-pole antenna is doing better than me! Grrrrrrrr....

(Congrats anyway, Bill!)

230. APRS SAREX final info needed

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 5 Jul 1996 14:12:30 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960705133504.14849A-100000@arctic>
Rendered body type: text/plain

We need to understand the differences between successful and unsuccessful stations. Be brief, but tell us needed info about your antenna path to the shuttle, your RCV/XMT losses and OPERATIONS. Here are my BRIEF reports:

```
WB4APR STATION: NO success.  Copied probably 10% of all packets reported
  OPS:      On freq and ARMED 100%.  Manned during waking (non workhours).
  ANT:      6db High gain omni antenna (poor elevation gain)
            good horizon in all directions.
  PWR:      40 watts
  LOSSES:   120 feet of 75 ohm hardline
  COMMENTS: Looks like I need to check my antenna (last ck 5 yrs ago)

W3ADO STATION:  NO success.  Copied probably 10% of packets reported
  OPS:      Monitor 100%, Manned during working hours.
  ANT:      Long Yagi, AZ-EL
  PWR:      25W
  LOSSES:   120 feet of RG-8
  COMMENTS: 100w amp and remote pre-amp smoked on day 1, so the 6 db
            of cable loss on XMT and RCV killed us.  ALso, all unmanned
            passes would have the beam not tracking, missing all but the
            one pass optimized.

I do not need a list of every pass that you manned, but just a percentage
of your efforts compared to ONLY THOSE PASSES WHERE PACKET was active.
Send all replies to me, and not the SIG to help minimize QRM.
```

232. MAR-6 update.

From: Bernard Seront <seront@seism1.ess.sunysb.edu>
Date: Fri, 05 Jul 1996 15:37:20 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960705193720.00896b34@seism1.ess.sunysb.edu>
Rendered body type: text/plain

```
Just a short notice to inform everyone on the evolution of the process.

I received the MAR-6's early this week. I'm ready to ship them back.

I had send personal e-mail last week to all the interested parties with
details about payment, address... I know that at least one of these e-mail
bounced (K5AHE, for instance, can't get an e-mail to you now).
I already started shipping to those who answered.

A copy of the above mentioned details is at the end of this e-mail so
hopefully everyone will get it now.
Address and phone (at work) are there too, BUT phone is not a good way to
reach me (doing experiments in a not-phone-equipped lab, most often I can't
answer).

I started to put together some ideas and a possible layout for the pre-amp,
I will upload that as time permit... (deadlines, papers and such, those
working in academic environment know that). I'm working on a prototype too...

----------------------------

Hi,

I received confirmation that the MAR-6 will be shipped to me before June 27.
It's now time for you to send me your payment so I can re-ship your units as
soon as possible.

Send me your payment, by check, money order, or even cash in the envelope
(but you take the responsibility if I don't receive it), in US$. The price
is still 2$ per unit, :-), including handling, shipping, ...
```

My address is:

Bernard SERONT
Earth and Space Sciences
State University of New York
STONY BROOK, NY, 11794-2100.

Just attach a short note with your payment with the quantity of MAR-6 you want, and if you want the standard case or surface mount. Don't forget to put YOUR address somewhere, so I know where to ship!

or just print and fill (or fill and print) the following:

```
--------------------------------------------------------------

          Name  :
Street Address  :
                :
                :
                :
Town, State, Zip:

MAR-6 standard case   :  Qty:    * 2$   =
MAR-6SM surface mount :  Qty:    * 2$   =

Perhaps they are having the same trouble that I am having. I've left APRS 76E on in space mode for all passes the last 3 days and it has yet to trigger even though it is armed and has received w5rrr-1 3 times.

Bill,

I sent one message to aprssig@tapr.org.

You got mine. I also got two copies. Mine, and one from someplace at "ny.us" . That is the one you replyed to.

I think someone sent you a message saying you can download the state files you want. He said something like 14Megs for Virgina. I checked TEXAS, it takes 48MEGS. But you can run without a CD drive in the laptop. Just laplink it over to your laptop.

"Not many (If any).." Well, I do. I'm just lucky that I have a laptop from work that does have a CD rom.

I know others do to. Last week I had to put some software on another laptop at work. First I had to make a set of 18 floppies from the CD...

I wish all the software would run on my ATARI 800, or KAYPRO 2, or my first laptop - T1100+. But the software just gets bigger.

Precison Mapping 1.1 GPS is an example of great software, for a fair price... but does take up room.

Still needs APRS tho. I did notice that Softworks has a PM 1.1 GPS "Developers" kit. Maybe the brothers or Bob will port...

Installing Map Data on a Laptop

Precision Mapping data can be installed manually on a laptop for use when a CD-ROM is not
available.  This procedure is not recommended and is not supported by technical support.  The
following procedure describes the manual installation of map data:

1)  Copy all of the files (excluding sub-directories)  in the sub-directory of PMAP on the CD-ROM
drive to the sub-directory where Precision Mapping 2.0 is installed ( usually "C:\PMAP2W" ).

2)  Copy the sub-directory of the desired state or states that you wish to use into the
sub-directory where Precision Mapping 2.0 is installed ( usually "C:\PMAP2W" ).  The result
should create a sub-directory in the PMAP2W sub-directory with the state data file.  Each state
data file should be in its own state sub-directory.

3)  In the Precision Mapping configuration menu, change all path statements to reflect the new
data location ( change all paths to "C:\PMAP2W" ).  Save and exit out of Precision Mapping.  The
next time you begin Precision Mapping, the program should recognize the new data and location.

IMPORTANT NOTE:  After copying all files over, turn OFF the READ-ONLY attributes.  If this is not
done, the system will not recognize the data.

Under License this data and software should not be used on more then one system per registered
copy of Precision Mapping 2.0.

240. APRS Sarex: I made it!

From: Andy Latovich <andylato@prolog.net>
Date: Sat, 06 Jul 1996 00:15:23 -0400
To: Aprs Sig <aprssig@tapr.org>
Message-ID: <31DDE85B.5C20@prolog.net>
Rendered body type: text/plain

Hi Everyone,

It looks like I got digipeated through the shuttle Friday morning. Here is a clip from the pass, my call is WB3JNZ and the timestamp is EDT and about 21 seconds behind the correct time.

```
-------------------------------------------------
W5RRR-1>W2RS [07/05/96  03:54:08] <I S0 R0>:
#1256-is your STS-78 SAREX QSO number.

W5RRR-1>N8IGJ [07/05/96  03:54:13] <DM>
W5RRR-1>W2RS [07/05/96  03:54:14] <UA>

WB3JNZ>FN10RS,W5RRR-1* [07/05/96  03:54:19] <UI R>:

W5RRR-1>W2RS [07/05/96  03:54:20] <I S0 R0>:
#1256-is your STS-78 SAREX QSO number.
-------------------------------------------------
```

... and again the next pass:

```
-------------------------------------------------
W5RRR-1>N3OWA [07/05/96  05:28:03] <UA>
W5RRR-1>WB4FIN [07/05/96  05:28:04] <I S0 R0>:
#1288-is your STS-78 SAREX QSO number.

W5RRR-1>WB4FIN [07/05/96  05:28:04] <UA>

WB3JNZ>FN10RS,W5RRR-1* [07/05/96  05:28:09] <UI R>:

W5RRR-1>N2UME [07/05/96  05:28:09] <UA>
W5RRR-1>WB4FIN [07/05/96  05:28:12] <I S0 R0>:
#1288-is your STS-78 SAREX QSO number.
-------------------------------------------------
```

I did not copy any other position reports during those two passes. Steve, VA3HOI's message and Bob's Sarex report to the sig confirms they saw my call on the map. Due to lack of time, this was the first pass I was available to make an attempt. This was a manual attempt since the date and time on the XT

class computer I use for packet has a nasty habit of going crazy after running a program a while. This really messes up the APRS timing and I didn't want to control a transmitter with that setup. I used my GPS-20 board to find my latitude and longitude and then APRS to find my grid square. I then set the unproto call to my gridsquare via W5RRR-1 and used the Procomm terminal program to talk to my TNC (a MFJ-1278B). With the proper TNC settings I could enter converse mode and monitor incoming packets. When I got good packets from the shuttle, I just had to hit the return key to send a very short packet. It it only took a couple of transmissions to see my digipeated packet! I tried again the next pass and was sucessful again! I think the very short packets helped a lot. I have TXDELAY set to 250ms and should be able to go lower. I wanted to try a third pass but the lack of sleep caught up with me and even the alarm clock didn't help. I hope to try some more passes when I can.

I use a HTX-202 to a Ramsey 2M amp with internal preamp, giving about 25 watts into a homebrew tin can cavity filter and about 100 ft of very very old RG-8 cable, (got some loss there!), to a KLM-14C antenna. The antenna does not have an elevation rotor or preamp. The old XT will soon be replaced with an old 286 so I can then run APRS without the date/time problem. Since most passes are close to the horizion, lack of elevation does not hurt much. I do notice deep fades when the shuttle is above 30 degrees elevation which is not very often. Due to mountians, I don't receive strong signals until about 10-15 degrees elevation.

I've been reading and enjoying the sig for a few months now and have been pretty quiet. It's been very interesting and informative. I hope to get some time and become more active with APRS soon. Bob, I guess you can add my call to the list of APRS stations trying to digi through the shuttle even though I am not actually running APRS. I am using the same format as APRS/APRTrak and anyone on the receiving end won't see any difference. I think that should still count me as an APRS station since I would be running it if I didn't have the problem with the XT.

Ok, I guess this first message to the sig is long enough. I hope to show up on your maps again soon!

```
     ---------------------------------------------
        Andy, WB3JNZ, andylato@prolog.net
     ---------------------------------------------
```

242. SAREX update...

From: ku0g@sprynet.com
Date: Sat, 6 Jul 1996 04:01:57 -0700
To: aprssig@tapr.org
Message-ID: <199607061101.EAA14477@m1.sprynet.com>
Rendered body type: text/plain

Three passes went by here with no activity heard overnight.
I listened to the passes at 0700, 0930 and 1100 (approximate times). Never a peep from Columbia either voice or packet...Has SAREX been shutdown in preparation for landing tomorrow already? Sure seems a shame if it has...

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator
EMail: ku0g@sprynet.com

243. Ultimeters CHANGED

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 6 Jul 1996 08:51:45 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960706084902.29721A-100000@arctic>
Rendered body type: text/plain

I was just informed of a production change in the Ultimeter 500 and 2000. THey have added 8 additional bytes onto the data format and since APRS uses the character count as a validation of the string, these new devices will NOT work with existing versions of APRS!

I will fix it. But if you just got a new ULtimeter, this may explain why it doesnt work with APRS!

246. Re: [APRSSIG:2810] Re: 76e map display "bare"

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Sat, 6 Jul 1996 09:00:54 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <199607061400.JAA00352@vanilla.cs.tamu.edu>
Rendered body type: text/plain

For what it's worth, I experimented with the Radio Shack Disk Cone antenna for SAREX ops and was pleasantly surprised. For an omni of reasonable cost, it's pretty decent, and provides a reasonable pattern for LEO ops. I strongly recommend some additional power, regardless of what you're using. I tend to use 160 watts for most SAREX activities, both voice and packet, for assured success, although I've done OK with 10-35 watts, too... just not as reliably.

One minor advantage I have in this area is that I can catch ascending passes over western Mexico, and not have to compete too much with other stations. One disadvantage I had this mision was, every TNC I own, as well as all my lab owns, were working on cows, airplanes, buses or police cars! Maybe next time I'll have one rededicated to a ham rig?

73, gerry

>
> Since this differs from both the single packet APRS digi and the single QSO
> connection confirmation, can someone explain what I've seen?

What you witnessed was the QSL list which is transmitted periodically so that SAREX stataions on the ground can snag it and route it to JSC for archiving. the memory on the old, venerable, wheezing HK-21 TNC can store about 600 QSO numbers. After that, it's a FIFO buffer. We count a lot on folks reporting honestly that they got a QSO and what number it was. The list is an easy way to make the QSL cards out early.

There's also a QRZ list, which is a longer version of MHeard. The EPROM on that HK-21 has been massaged somewhat for special SAREX operation.

Hope this helped.

249. KB0UZQ's infamous overnight APRS/STS-78 contact report...

From: byoung@qni.com
Date: Sat, 6 Jul 1996 09:22:29 -0500
To: aprssig@tapr.org
Message-ID: <9607061422.AA05226@qni.com>
Rendered body type: text/plain

Fellow APRSs,

Not a sound, voice or data, has been heard from the shuttle here in Smithville, MO (30 miles north of Kansas City, MO and in the CDT time zone...) since 0600CDT 05JUL96.

Looks like "The Party's Over"! I assume they'll be packing SAREX up early today if they haven't already. (On the other hand, "just in case", my APRS is still "cocked and locked" and will be till later today! Hope springs eternal!)

Who remembers their Latin? We need to come up with a motto, in Latin of course, that expresses our insane devotion to contacting the shuttle. Submit any ideas to me via E-Mail, and (if I actually get any...) I'll share them with the group in a single posting (to reduce QRM).

I just got WinAPRS installed! Is it normal to see stations 800 - 1000 miles away or is there a band opening? I'm seeing, among others,   VE3NP, KB1DD, N0AN, and N6OAA. I'm in Granbury, Tx. which is 35 miles SW of FT. Worth.

ALL APRS, Maryland, New Jersey Chesapeak area.

   Received Packet message from Harry/N2ERN@W2LI.NJ.USA.NA as follows:
QUOTE;
  Just getting started here with APRS. Three Agrelo DFjr on order. Do
you know anyone who might have some maps of central New Jersey? Would
appreciate any references to getting started. Tnx, Harry N2ERN..
UNQUOTE..

   Hey Joe, with an order for three best help him out. Anyone near this
fella, please give him a hand getting started.

   Anyone copying our TRANSPAC96, Solo Yacht race to Hawaii. ??? am Uplinking
positions daily on HF/10151, Ken/W7KKE is Uplinking the Victoria,BC- to
Hawaii boats also. Starting Monday about 60 S/V boats will be on another
Transpac LosAngeles to Hawaii, starting Monday. No info if APRS envolved.
Info can be found : http://www.sfbaysss.org/transpac96/ on West coast
sailing events and at the : http://www.wingo.com .. site.

  73's & Enjoy, Bill/WB6LPG

252. Revised Hurricane extractor

From: KSwaggart@aol.com
Date: Sat, 6 Jul 1996 10:30:07 -0400
To: aprssig@tapr.org
Message-ID: <960706103007_350375636@emout07.mail.aol.com>
Rendered body type: text/plain

Hi again,

 I inadvertently uploaded my test copy of WXHURR1.* which had canned test
filenames. A corrected .zip file named WXHURR2.ZIP has been uploaded to
tapr.org.

 This program extracts Tropical Depression, Tropical Storm, and Hurricane
positions and projected tracks from the National Hurrican Center marine
advisories. An APRS backup file is created which can be loaded into APRS and
uplinked to the net if desired.

73, Ken, W7KKE

Aha.  You weren't listening (:-) when I noted earlier, re: PM 2.0:  for limited
statewide coverage, you can move the appropriate files to hard disk, and tell
PM 2.0 where it is in the configuration file.

The down side is, the files they are using are not quite as good as De Lorme's
files.  From what I can tell, De Lorme have worked a deal with individual
state Dept's of Transportation for TIGER format updates, which they then
(occasionally) integrate into their standard distribution.  Several weeks ago,
I pointed PM's designers toward the WWW site in Texas for things such as
these.

SB SAREX @ AMSAT $STS-78.027
STS-78 SAREX Bulletin #27

Silver Spring, Maryland USA
July 5, 1996 @ 16:00 UTC

As the Life and Microgravity Sciences mission draws to a close over this weekend, SAREX on STS-78 will be remembered by many amateur radio experimenters and students for years to come.

Education scored outstanding achievements on three continents. The scheduled SAREX contacts were 100% successful with the eleven school groups across Australia, France, Canada and the USA. The students' interest in space, math, science and technology were sparked through their contact preparation, as well as by the answers to their combined total of 116 questions posed to six Columbia crew members. Amateur radio and the schools enjoyed substantial news media exposure with multiple television crews and several newspapers visiting nearly every contact site.

Hundreds of random voice contacts were established with hams worldwide, with the number still climbing. Signal strength and gravity-gradient propagation observations are being shared freely among experimenters both on-the-air and through the Internet mail list sarex@amsat.org. New list members are added frequently by e-mailing their request to Paul Williamson at listserv@amsat.org.

Crew members are heard using their personal call signs and often honor their Johnson Space Center Amateur Radio Club by using W5RRR. At times, the simple phrase "Space Shuttle Columbia" has given away the voice from space.

The packet radio robot beacons messages of greetings to the world, as updated occasionally by various members of the crew. The normally tireless W5RRR-1 has not been active during crew sleep periods during this mission, yet the packet QSO count was above 1300 in number this morning and climbing.

The SAREX equipment will be stowed by about 24 hours before landing. However, many in North America will enjoy early morning sighting opportunities depending on one's local lighting conditions.

Landing is scheduled for Sunday, July 7, 1996 at about 12:30 UTC.

Here is the latest Keplerian element set from Gil Carman, WA5NOM, of the NASA/Johnson Space Center:

```
STS-78
1 23931U 96036A   96187.69158781  .00088752  00000-0  12713-3 0  9197
2 23931  39.0136 268.7820 0005581  26.2942 333.8320 16.04641595  2431

Satellite: STS-78
Catalog number: 23931
Epoch time:      96187.69158781   =     yrday.fracday
Element set:     919
Inclination:       39.0136 deg
RA of node:       268.7820 deg
Eccentricity:     .0005581
Arg of perigee:    26.2942 deg
Mean anomaly:     333.8320 deg
Mean motion:   16.04641595 rev/day
```

```
Decay rate:    8.87520E-04 rev/day^2
Epoch rev:             243
Checksum:              337
```

According to Gil, this set will be good through today and until the trim burn on Saturday morning. That burn will be at approximately 1300 UTC, and will lower the altitude by about 5 n.mi., resulting in the orbiter appearing slightly earlier than these elements predict. A Detailed Test Objective (DTO) will raise the orbit by a mile or less and is not expected to further alter one's predictions significantly.

Submitted by (Pat Kilroy, WD8LAQ for) Frank H. Bauer, KA3HDO for the SAREX Working Group

Notes: These times and elevations are at the point of closest approach (peak elevation) for each city. ELSUN is the Sun's elevation for that city at that time. BOOM is the estimated length of time (MIN:SEC) after closest approach when the sonic boom may be heard. However, it is unlikely that the boom can be heard if peak elevation is less than about 20 deg. The fireball and plasma trail should be visible in twilight over northern California and southwestern Utah, but will not be visible east of Utah because it will be in daylight then.

Thanks, Gerry - that may be the only surviving documentation of my
digi'd packet.  Murphy was definitely here that morning, as five minutes
after the pass ended (AND before I had time to save the log) APRS locked
up when a completely malevolent DOS program was started by the Win95
task scheduler.  Naturally, it being 4 am, I wasn't coherent enough to
write down the qso number from the screen either (it had minimized when
the other program started).

It sure was a fun experiment, though.  After reading your comments about
uplink power, I realize that my 10 watts and very small beam were just
about the absolute minimum required to do the job!

Clearly, there were a lot of sleepless nights for folks on the sig - and
I have to say,  IT WAS WORTH EVERY SECOND OF IT!  Can't wait for the
next APRS-permitted mission!

Regards the Developers kit for PM 2.0:  I have it and have made small steps
toward getting calls off the TNC for multiple vehicle tracking.  MY initial
work is multi-phase:  Work R&D related as well as ham implementation, but with
NO support for decoding wx or other special APRS "stuff" that will take
significant time.  Vehicle tracking is what I have to concentrate on.  I'll
advise when I have some code to share, but I can't say when

For what it's worth, APRS will receive a prominent mention at the GIS/LIS '96
meeting in Denver, Nov 17-21:  Cows In Space will be presented there at our
first major (and second real) meeting.  APRS with Bob's modification to allow
continuous NMEA logging was instrumental in capturing data.

This, and a set of new projects, plus promotion to a senior researcher, are
really clamping down on my hobby development time!

ALL APRS SIG'ers... GPS/GLONASS INFO.. 061600GMT JUL 96

Very interesting and informative 7 page article in the May/June issue of Marine Electronics (the official journal of the NMEA), p29.

Explains and describes the technical, electronic features of both GPS and the Soviet GLONASS systems, Integrity, Accuracy, How both work, Basic Idea, Satellite Ranging, Signal Structure, PRN codes, Frequency, Almanacs, EPHEMERIDES, (whatever that big word means) and much more.

The Ashtech GG24 Receiver, (only one copying both GPS/GLONASS) in one receiver and available in two different formats: 1. OEM Board, Eurocard Format, 2. Sensor, with power supply and internal PCMCIA memoray card.

(Ashtech in Sunnyvale CA. no address, Phone 408-524-1400), no prices listed I called and asked for brochure/price.. Reported to be very accurate 1-5meters copying 12 stallites from each,both GPS & GLONASS now in obit and operational. GPS FEQS- 1575.42MHz/1227.60, GLONASS on 1602+Kx0.5625 MHz,Ke[-7,24] and 1246+Kx0.4375 MHz, Ke[-7,24] whatever that means. Hi..

Those intgerested might also call NMEA for reprint of article 919-638-2626, FAX 919-638-4885, will probable be charged.

Also a two page article on Leica GPS Division, who acquired Magnavox GPS systems, may be possible for tech support to those on sig who acquired the Magnavox MX4200 GPS Receivers, reciently from surplus. Call Scott Lee, Leica GPS, 23868 Hawthorne Blvd, Torrance, CA. 90505. Phone 310-791-5300, FAX 310-791-6108..

"Disclamier.. I am in no way connected or associated nor do I receiver monitary benefits from any of the above named enteprises. This info for benifit of my fellow sig members.."" No flames, no more questions please.

73's & Enjoy, Bill/WB6LPG @ KA6EYH <wbliss@coastside.net)

See "http://www.sfbaysss.org/transpac96/" for Yachting info on Pacific ocean and west coast. Uplinking posits on APRS via HF/10151 an additional Vancouver,BC to Hawaii race at this time and Mon 7/8 the LAX/SDiego 60 boat Transpac Race to Hawaii begins, unknow if any APRS envolment. Why not APRS'rs in S-Calif. ?????

266. Shuttle Ionization APRS reception

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Sat, 6 Jul 1996 13:29:37 -0500
To: aprssig@tapr.org
Message-ID: <v02140b00ae045fd2ff0d@[204.251.33.23]>
Rendered body type: text/plain

Tomorrow morning, as the Shuttle reenters, the ionization trail should provide a reflector for VHF packet APRS posits. Watch your maps during the following times:

Event	Time UTC	EDT	CDT	MDT	MST/PDT*
Arrives over West Coast	12:14	8:14	7:14	6:14	5:14

Enters Nevada	12:15	8:15	7:15	6:15	5:15
Overflies "Four Corners"	12:17	8:17	7:17	6:17	5:17
Overflies Dallas, TX	12:21	8:21	7:21	6:21	5:21
Overflies Mississippi Coast	12:24	8:24	7:24	6:24	5:24
KSC Touch down	12:37	8:37	7:37	6:37	5:37

Perhaps we could get local GATEs to observe radio silence during that time.

Hi Bob, what is new, mine was purchased at Dayton, I believe mine works alright with Dos and Mac versions, but I am curious does these new units do something more with these 8 bytes, anything we users should be concerned about?

270. APRS/TRANSPAC96 SPECIAL EVENT

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Sat, 6 Jul 1996 12:13:58 -0700
To: aprssig@tapr.org
Message-ID: <199607061913.MAA09842@poseidon>
Rendered body type: text/plain

APRS SPECIAL EVENT...
  The Singlehanded Sailing Society Solo Yacht race, underway since Noon last Saturday June 29th. Mike/WD6EHQ on S/V Foxx Fyre has been passing twice daily AM/PM Position reports on the 16 Yachts, to Bill/KB6LFM on Pactor 14065/10137 Kcs. We then relay to Yacht Comittee via Fax, to parties on Internet, and other Hams. Reports and comments appear on local Packet BBS (APRS@ALLUS).
  I have uplinked all on HF/10151 for any/all APRS HF to downlink to their own area VHF stations. Would appreciate any reports on how far back EAST/NW/SW/MidWEST any/all have copied.
  Also a Victoria, BC to Hawaii race has been plotted and uplinked of another Yacht race , all boats now in same area.
  Monday a 60 boat fleet, will leave SanDiego/Lax area Monday 8th, don't know if any APRS coverage or not.
  We need efforts to get more S/V and Yacht Clubs interested in APRS for tracking. Anticipate a Calif to Mexico race this Fall, and hope to have Rick/KN6KB , S/V SECOND WIND, running GPS tracking sometime in November.

More info on your Internet Address, Yachting, Sailing, Weather.

http://www.sfbaysss.org/transpac96/ , also just search with words Sailing will get you much info.

73's & Enjoy, Bill/WB6LPG@KA6EYH <wbliss@coastside.net> just past 70 and still kickin. 7/3/26

I got my 500 a few months ago and had a heck of time getting it to work with
the computer. Peet Bros replaced everything to no avail. I gave up. At
Dayton I talked to William J Peet II who informed me that they developed a
new data cable from the key-pad to the computer. Instead of the DB-9 they
went to a RS-232 connector. Something about the newer computer's have a
reference voltage change from older model's. At any rate this finally did
the trick for my system and I run 76e with no problems that I am aware of.
Hope this tib-bit is of some use.
Will wtach the SIG further info. 73 de N8NYU

272. MAR-6 update.bis

From: Bernard Seront <seront@seism1.ess.sunysb.edu>
Date: Sat, 06 Jul 1996 16:32:21 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960706203221.00891a2c@seism1.ess.sunysb.edu>
Rendered body type: text/plain

```
Sorry if this is the second time, but it seems the first try didn't made it
through:

Just a short notice to inform everyone on the evolution of the process.

I received the MAR-6's early this week. I'm ready to ship them back.

I had send personal e-mail last week to all the interested parties with
details about payment, address... I know that at least one of these e-mail
bounced (K5AHE, for instance, can't get an e-mail to you now).
I already started shipping to those who answered.

A copy of the above mentioned details is at the end of this e-mail so
hopefully everyone will get it now.
Address and phone (at work) are there too, BUT phone is not a good way to
reach me (doing experiments in a not-phone-equipped lab, most often I can't
answer).

I started to put together some ideas and a possible layout for the pre-amp,
I will upload that as time permit... (deadlines, papers and such, those
working in academic environment know that). I'm working on a prototype too...

----------------------------

Hi,

I received confirmation that the MAR-6 will be shipped to me before June 27.
It's now time for you to send me your payment so I can re-ship your units as
soon as possible.

Send me your payment, by check, money order, or even cash in the envelope
(but you take the responsibility if I don't receive it), in US$. The price
is still 2$ per unit, :-), including handling, shipping, ...

My address is:

Bernard SERONT
Earth and Space Sciences
State University of New York
STONY BROOK, NY, 11794-2100.

Just attach a short note with your payment with the quantity of MAR-6 you
want, and if you want the standard case or surface mount. Don't forget to
put YOUR address somewhere, so I know where to ship!

or just print and fill (or fill and print) the following:

--------------------------------------------------------------

          Name  :
Street Address  :
                :

279. GPS-20 less deaf

From: David Rush <n0oxh@alikazam.sprintcorp.com>
Date: Sat, 06 Jul 1996 23:30:16 -0500
To: aprssig@tapr.org
Message-ID: <199607070430.XAB00775@alikazam.sprintcorp.com>
Rendered body type: text/plain

```
Folks:

>From day one my GPS-20 has been spitting out out data, but has not yet
gotten its first fix.

Until today, all I could see was the unit cycling through all of the
```

satellites, never reporting more than one at a time.

After watching it do this for a couple of hours today, I pulled my GPS-20 off the roof and installed a pair of 10 uF caps; one on the input and one on the output of the 7505 regulator.

It now reports a slowly changing variety of eight satellites, with varying azimuths. But most of the elevations are zero. Typically I'll see just two birds with non-zero elevations. After running for quite some time, I started seeing non-null S/N reports, but never more than two at once, and more typically just one.

It ran like this for about three hours. Still no fix. The clock is about 25 seconds off, and I'm just a few miles from Garmin here in Kansas.

Here's some sample output:

```
$GPGGA,032807,,,,,0,00,,,M,,M,,*68
$GPGSA,A,1,,,,,,,,,,,,,,,,*1E
$GPGSV,2,1,08,03,,115,,04,35,258,,21,,013,,23,,350,41*7A
$GPGSV,2,2,08,24,05,243,,26,,271,,27,17,208,,28,,127,*70
$PGRME,,,,,,*4D
$GPVTG,,T,,M,,N,,K*4E
$GPRMC,032808,V,,,,,,,070796,,*3F
$PGRMT,GPS 20-00 VER  1.33 ,P,P,R,R,P,,42*1F
$GPGGA,032808,,,,,0,00,,,M,,M,,*67
$GPGSA,A,1,,,,,,,,,,,,,,,,*1E
$GPGSV,2,1,08,03,,115,,04,35,258,,21,,013,,23,,350,41*7A
$GPGSV,2,2,08,24,05,243,,26,,271,,27,17,208,,28,,127,*70
$PGRME,,,,,,*4D
$GPVTG,,T,,M,,N,,K*4E
$GPRMC,032809,V,,,,,,,070796,,*3E
$GPGGA,032809,,,,,0,00,,,M,,M,,*66
$GPGSA,A,1,,,,,,,,,,,,,,,,*1E
$GPGSV,2,1,08,03,,115,,04,35,258,,21,,013,,23,,350,41*7A
$GPGSV,2,2,08,24,05,243,,26,,271,,27,17,208,,28,,127,*70
```

Anybody have any ideas about what's wrong? Should I try smaller caps? What are the *hh fields at the end of each sentence?

I'm using a quarter-wave ground-plane antenna, made from RG-58. Feedline length is the length of the supplied mini-coax, plus about three inches of RG-58 before its split open for the antenna.

>
  I went thru awsum gyrations to get the regular mapping program to run  on
my non-cd equiped laptop. I was able to get the mapping program and GPS
program to run on my laptop. I was told my e-mail support from the company
to copy the state map to a specific directory. I then looked at the file for
Illinois. it was 17MEGS!! I managed to laplink it over but the program didnt
recognize it. Even though I bought the program, no further info/support was
forthcoming to fill in the Grand Canyon wide gap of how to make it work
right. I remarked that they make a way to create installable floppy disks or
some other creative way to install the needed files w/o a CD. I didnt get
the courtesy of a reply.
 On my desktop unit I could get the mapping and GPS software to work great.
Unfortunately the PC is in the basement and the GPS doesnt read satellites
too well there. So.... I'm not too inpressed with it yet enough to plunk
down another 60 bucks to run it on my laptop. Maybe the developers should
get their laptops with cd-roms taken away and then make them re-write it for
us normal folks.

To: "'APRS SIG'" <aprssig@tapr.org>
Message-ID: <01BB6BCF.862E3C80@ttyEJ.emi.net>
Rendered body type: text/plain

For a school project, I have to log differential GPS position, compass heading, and depth of seawater and plot depth vs. position. I will have a Garmin 45 with the GBR-21 Differential Receiver, an Autohelm ST-30 Digital Depth Sounder, a KVH 1000 Magna Flux Compass, an NMEA 0183 Interface block (takes up to 4 NMEA inputs and outputs to a single RS-232 port, price $189), and a 486/33 laptop.

Can I use APRS for this or do I have to purchase the $2000 Micro Nav marine data logging package for this? I have to fund this out of my pocket and have been able to scrounge the hardware, software is now the issue. Thanks for your help in advance.

To: aprssig@tapr.org
Message-ID: <9607071436.AA19409@ELWOOD.pionet.net>
Rendered body type: text/plain

I have uploaded to TAPR a full set of maps for the state of Nebraska. There are 24 32 mile maps as well as a map of the state showing all counties. The files is zipped as per the documentation supplied with APRS. The set is called NEMAPS01.ZIP. It was in the upload area at TAPR but I'm sure it has been moved by now.

Since this is my first major attempt at map making any and all comments (or problems) would be appreciated.

Jay:  You didn't mention what you were using for a NMEA interface, but I
assume it's an electronic device that accepts NMEA from the various
sources and outputs them sequentially to the RS-232 port and into the
computer.

Once you have the NMEA data coming into the computer you don't need (I
think) the Micro Nav data logger.  I believe just about any software that
does the logging for you will suffice.

You should be able to find plenty of software to help you out at Peter
Bennet's ftp site.  Start at

    http://vancouver-webpages.com/peter/index.html

Good Luck,

Lew

I'm not quite sure what you are trying to do, and what your interfaces are,
but I have been doing a lot of work for an upcoming book on GPS involving
the comparison of various receivers and systems. In order to do this, I
needed to perform large data takes using many receivers at the same time.
To do this, I used Windows 95, a multiple (8 port) serial card from Comtrol
(it is called a RocketPort), and the latest version of Delrina Wincom.
Using this I could open up to 11 simultaneous comm sessions (actually 10
since my mouse uses one comm port, but who's counting). Then, I could log
all the data I wanted, and save the data to files, and then do whatever I
wanted to with the data later. It is one of the only comm programs that I
know of that will support comm ports beyond 4, and it is also one of the
only ones that will allow you to have multiple instances of the program open
at the same time. It worked flawlessly for me. Of course if you don't need
more than 4 comm ports, you can just go with conventional i/o boards, and
save a bunch of money, since the Comtrol board is a few hundred bucks.

Hey Bill,

I just downloaded your latest files within (dfjrcard.zip). Looks good
but I have a couple of comments. Your spelling of Treshold is incorrect,
it should be Threshold with an "h". Funny thing...I wonder if there is
something wrong with the "h" on your keyboard, cause I noticed in lots
of your e-mail you always leave out the "h" in words like though, and
through.

Also where you have Agrelo Engineering, Home of the DFjr, it would be
nice if you added our phone number (800)588-4300.

Credit, where credit is due-
You did a very nice job of enhancing the original card from Mike Musick
N0QBF, Thanks! to both of you for saving me the time of doing it myself,
which it seems I have less and less of lately;-)

I will add a link from our web site to obtain the card, when it's
complete.

Message-ID: <199607071950.OAA19253@tapr.org>

Rendered body type: text/plain

Greetings.

Here is an update on round two of the TAPR group buy on GPS-20 units.

As of today (7/7/96) the TAPR office has received orders for 40 of the 75 units required.

We need another 35 orders before we can place the group purchase.

Information and pictures on the GPS-20 are available at
http://www.tapr.org/gps

Cheers - Greg, WD5IVD

295. Mobile

From: Richard Ball <72155.1222@CompuServe.COM>
Date: 07 Jul 96 16:01:44 EDT
To: APRSSIG <aprssig@tapr.org>
Message-ID: <960707200144_72155.1222_EHB176-1@CompuServe.COM>
Rendered body type: text/plain

I just got a mobile system going in my car. A Garmin45, KPC-3 ver6 with HSP cable, 2meter radio, and an old Toshiba laptop. I have been able to get the mobile -9 to show on my computer at home, and on the two other peoples in the area here (Seattle) running APRS.

Every time I go out in my car I have tried to run APRS. But it has gotten to be a PAIN to put the laptop in and out every time I stop at a store or the 'mall'. I don't like to leave the computer in the front of the car in the parking lots. The other equipment is out of sight. Also on long trips the old computers battery runs down.

Being new to APRS and not having anyone at home to ask, I thought I would ask here on the sig. Hope its not to basic.

I did put the KPC-3 in 'GPS' mode once, and tried it without the computer. And boy did I have a time getting it out with the three CTRL 'C's. I guess I would like my cake and eat it to. Can I run with the computer some of the time and at other times without, and doing it easy?

My thinking was when the computer starts APRS, to use the INIT file to change the KPC-3 out of GPS mode, and when QUITing to reset it back into GPS mode. But I can't seem to get this to work.

Am I approaching the problem wrong? Am I making a mountain out of a mole hill? Did I miss something in the DOCs? What are others doing?

Richard N7RIG

javAPRS is coming along great. Check it out if you haven't recently:

<http://www.bridge.net/~sdimse/javAPRS.html>

javAPRS now does GIF maps, and reads Kantronics TNC data, NMEA data and HST files, as well as a couple formats for its own use. More formats on the way soon. Also there will soon be instructions on how to make javAPRS work on your home page. Check back often.

These examples are running now:

javAPRS.html...see the NMEA data logged on a trip from the Keys to Miami

trip.html...see what I saw as I drove to Dallas for the TAPR DCC last September.

hurricane.html...Hurricane tracking. For now I have to manually update this, so it won't be as up to date as other tropical weather sources, so don't depend on it!

marathon.html...a replay of the marathon.hst file included in the APRS distribution.

gifmap.html...watch me head into the Keys back country for some fishing, plotted over a scanned-in nautical chart.

Please send me your comments/suggestions. I've got to finish the paper on javAPRS for DCC, so the improvements may be a little slow for the next couple weeks.

Are there serial numbers available or shipping dates of affected units. Also does this affect anything if the unit is operating as a stand-alone U-2000 to TNC to Radio device?

Here is what I learned from an earlier query that I put out about getting back into the kpc-3 when it is in GPS mode: DO NOT USE A PACKET PROGRAM to communicate with the KPC-3! I have had the best luck using the terminal program that came with Windows 95.
Three <control c> and wait a couple of seconds. Then try again.

I don't use my laptop in the van. I use the Garmin 45, KPC-3 and the TH-77 as a stand alone tracker.

I have a friend that uses the "remote" mode to get his KPC-3 in and out of GPS mode.

Has anyoe figured out how to power the Garmin 45 from the RS-232 port ont the KPC-3?

>
> Roy, N5TAM

Yes, I have devised a way to power the Garmin from the KPC-3 and will
show you at our earliest convience. Basically, I put a DB-25 connector
on the Garmin cable, brown to pin 2, black to pin 7, and red to pin 25
with a fuse soldered to the wires hidden in the connector hood. Follow
the directions in the KPC manual for "Powering the KPC-3 from the DB-25
port" It requires two jumpers soldered on the board. I don't think it
will work if you have configured your 25 port to do a hard reset because
it uses the same jumper, just on the other pin. This puts power to pin
25. Note: it uses whatever power you provide to the KPC-3, including
the internal 9-volt battery! Doesn't last long that way...But it Works
GREAT! I then power the KPC-3 from the truck through the regular power
connector. Voila!
THEN, I put a DB-25 connector on my Pac-Com HSP switch pigtails and run
power to the switch AND the GPS from the KPC-3 since my laptops don't
have power on pin 6 of the serial port. (orange wire to pin 25 of
both the tnc and the gps DB-25 connectors) You just gotta see it!
I just change INT to GPS on the KPC-3, plug the DB-25 on the Garmin cable
directly into it and have an instant tracker.

Note: I still can't get 3 <ctrl-C> to work to switch back from GPS mode,
no matter how long I wait or how many times I try it. Remote mode works
well enuf and I can leave the whole thing under the car seat when I get
home, just reset the BLT times and leave it turned on.

I was going against my old adage, if it aint broke....

Took the MFJ loop down and flipped it horizontally...Worked great,
until the bolts holding it broke and it aint gonna work until MFJ gets it..

With the storm coming (BERTHA) I had established a good APRS HF link with
 HH2B in Haiti.
  With some luck might be able to get something rigged up in the linited time
and linited space I have (apt dweller) But it is unlikely..
The timing of this event couldnt have been worse...

In any event the gate is off, I can tune the push up pole with my autotuner
but have not been able to connect to anyone.

... continued tale of woe deleted

The documentation tells you how to get teh data over, and then how to tell the

```
program where it is, so it can deal with it.  It *is* in there.  I didn't have
to get tech support to find it, so it Had to be obvious :-)

If you think 17 Mb is bad, try Texas with 48 Mb!  That's a disk-full.

the Justsoftworks staff I've talked to seem more than a little overwhelmed
with some of the release work they're doing these days. as well as with
updating the maps database to give DeLorme a run for their money.  This
represents a program with Tiger-level data that *can* be run from hard disk.
That's more than DeLorme can claim.

73, gerry

I uploaded the corrected DFjrcard.zip i have changed several things
including adding the phone number, and of course Mike's original concept
that i overlooked (Sorry Mike). Well i realy didn't overlook it since i
didn't know who did the original small card. But in any case that has been
taken care of on the front of the card. I also changed the DFjr marking to
it's design like on the front of the manual.

Another question Joe since i have your attention. Would you please post the
sizes of the connectors, like the power connector on the DFjr and the GPS
input on the MPA card. I looked through several catalogs and there are 3
sizes available and if you pick the wrong  size it will be to loose and may
fall out when on a hot trail of the fox Hi.

311. How I installed WIN32s in Win 3.1

From: "Arthur J. Martin" <amartin@world2u.com>
Date: Sun, 7 Jul 1996 23:12:20 -0400 (EDT)
To: aprssig@tapr.org
Cc: sproul@ap.org
Message-ID: <199607080312.XAA27412@ants3.world2u.com>
Rendered body type: text/plain

Just some of my experiences in getting prepared to run MacAPRS compiled for Windows 3.x   Source of the WIN32s is the file OLE32s13.EXE. You can try to download it from

http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/Draft/win32s.htm

Intallation help from

http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/Draft/WM063.htm

(Above locations provided in the WinAPRS documentation by Mark & Keith Sproul, co-authors of MacAPRS(tm) and WinAPRS(tm))

My procedure was to get the WinAPRS(tm) software (version 1.1.0, currently) See the sites at the end of this message for location.

1) download OLE32S13.EXE from the www site shown above

2) make a DOS directory (I named WIN32s) off the root "drive_letter:\WIN32S"

3) copy in the OLE32S13.EXE into that directory

4) Make sure I was in WIN32S directory

5) Execute the self-extracting archive (2.5 Meg) with "OLE32S13<Enter>" All the files in the archive will be left in the WIN32S directory. If you have a backup copy of OLE32S13.EXE stashed away then you can delet it from the WIN32S directory to free up some disk space.

6) Make sure that \DOS\SHARE.EXE is loaded in your CONFIG.SYS file. The Setup program checks for it and gets upset if it isn't running.

7) Start up your Windows 3.x

8) Bring up the Program Manager window

9) Select Run....

10) Type "drive_letter:\WIN32S\SETUP<Enter>" The Windows Setup program should run. Follow the prompts. Windows must reboot at the completion of Setup or you should do it manually.

11) Then create the WinAPRS(tm) group and it will create the group window. Setup the WinAPRS(tm) program info. If you wish, use any icon in the list, but it will be replaced with a USA map icon when you close Program window.

12) Starts by double clicking on the map icon. Since there isn't any printing support in the current versions while under windows, you may want to PRINT the docs out using MS-DOS beforehand.

Beyond this description of what worked for me in Windows 3.1, I assume no reposibility for anything you do. May it be a useful tool if you get stuck.

Good luck, all you brave folks out there! Remember, WinAPRS(tm) is NOT dosAPRS(tm) by Bob Bruniger and it runs slightly differently and is not in the same stage of development that dosAPRS(tm) is at. It does have other features such as support for callsign CD-ROMs in many flavors. As with the dosAPRS(tm) versions, registration lets you save your configuration file!

Worked for me... not guarenteed, but should be a help. GOOD LUCK!

APRSdos REPLY COMMENT: I told all of the TNC manufacturers from day one,
that they needed to come up with a way for the user to go from HSP mode
to GPS mode automatically. Only AEA and PacComm have done it.

PacComm's TNC with its 2nd dedicated GPS port will begin iperating in
stand alone mode as soon as it fires up and detects that APRS has not
been telling it to transmit at a time shorter than its preset GPS timing.

In other words, you set the TNC to do its GPS at once every 2 minutes
and then tell APRS do do it once every 1.5 minute. As long as APRS is
alive and well, then it is in control. If APRS does not key the radio,
then 2 minutes later the TNC will take over...

313. SAREX data needed

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 7 Jul 1996 23:36:13 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960707233246.16285L-100000@arctic>
Rendered body type: text/plain

In additon to a HST file of all reported SAREX APRS contacts, I also want
to make a .BK file of all ground stations trying! So if you were on the
ground and working the APRS SAREX experiment, then please send me your
LAT/LONG, symbol and attempted Beacon text.

THese days you can be a little house with a Veritical, a Beam, or a
satellite dish (implyin AS-EL antennas. Please indicate which for me to
use. Keep your replys brief so I dont have to dig too deeply.

If you were on the list of successful stations, then i ALREADY have your
data.

314. Moving with APRS

From: Randy Hammock <kc6hur@garc.gsfc.nasa.gov>
Date: Sun, 7 Jul 1996 23:53:02 -0400
To: "'APRSSIG'" <aprssig@tapr.org>
Message-ID: <01BB6C5F.94EA5A20@col-as6s56.erols.com>
Rendered body type: text/plain

On Wednesday the 10th of July, I will be setting out on a move back to California from Maryland.

My first day of travel will take to Peoria ,IL, then to Cheyenne, WY, then to Elko, NV, then to San Francisco, CA where I'll stay 2 night then on to Los Angeles on the 15th.

The system will be a Garmin 45 with the Trimble antenna, connected to a KPC-3, connected to an Alinco DR-1200T running 25 watts feeding a Larsen 2/70 on a mag-mount on the trailer.

Questions:
1. What should my SSID be set to?
2. What should the UNPROTO path be?
3. 145.790 is the prevalent freq, what other freqs and where should they be used?
4. Would $GPRMC be the best sentence to use?
5. What would be the best beacon time to use? Since multiple beacons can be programmed, separate times can be used for "local" beacons and those which would specify a gate.

Once all is said an done, I would be curious to see who logged posits from my trek across the country.

Randy Hammock KC6HUR

315. APRS Sarex report (15)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 8 Jul 1996 00:05:59 -0400 (EDT)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.960705224456.25119G@arctic>
Rendered body type: text/plain

SAREX was stowed about 24hours in advance for landing on 7 July.
This will be a preliminary final report until all the data is analyzed.
Currently we enjoyed 15 days of SAREX activity, with 20 voice passes, 25 packet passes and 11 school passes. That leaves only about 19 passes with no activity. A fantastic effort on the part of the STS-78 crew!

The positions of the following 18 stations were successfuly reported via SAREX as part of the APRtrak/APRS experiment: K1HJC, WB6LLO, KE6AFE, WB4LTF, N8DEU, KE4EER(WA8INZ), KB0UZQ, KC5EJK, KG0DW, N1JDU, KD1SM, N6HNY, WA4HEI, AD4BL, WB3JNZ, N2NRD, KC7CO, and VA3HOI. Two others reported STATUS, but no POSIT. A total of 65 APRS packets were received.

A detailed station summary is being compiled but indications are that about 10 APRS stations were making a serious effort and trying every pass:
WA8INZ,WB6LLO,KB0UZQ,KD4EMI N2THO,WB4APR,KC5EJK,AD4BL,KC4ZQ,WB4PAN.
Many other stations did passes when they could: N3MNT,N3IVO,N8EDU,AD4BL N2QAE,WA1LOU,KC7CO,N1CPE,WB5QLD,K1HJC,KE6AFE,KU0G WB4LTF,N5RKN,KC4NHB, AB5GE,KG0DW,KD1SM,N1JDU,KF4DYS,KK6IB,N6HNY,WA4HEI,KC4ZGQ,KI5VM,WB3JNZ, N2NRD,VA3HOI,W4NMK,WB3JNZ tried 2wice and got both successes.

Comparing the APRS success rate 65 pkts (for 39 people) to the total number of stations playing with SAREX, (1350 QSO#s), could imply a lower bound of 2200 or upper bound of 4200 total packet stations on frequency, all things being equal... Does that sound about right?

This SAREX mission was a real test of your overall station sensitivity. WIth the shuttle orientation often sending the SAREX signals out into space away from earth, you had to have minimum receive losses and/or use a beam. Ending with SAREX QSO#'s in the 1300's is down by a factor of 4 or so compared to shorter missions scoring into the 3000's. More later after I study the station reports submitted.

If you have other data or are not listed, pse report. I must get station data from all participating APRS stations whether you were successful or not. Here is the chronology of all packets reported.

Rendered body type: text/plain

[NOTE: Best when displayed/printed with a mono-spaced font.]

The following is a description of the connector wiring I use for the Garmin GPS-45 power/data cable to a DB-25M connector. This connection allows connecting a Garmin GPS to a KPC-3 for standalone tracker operation. Note the connections between the DB-25M pins 4 and 5, and 6, 8 and 20. This will dummy any flow-control signals to the device that the cable is plugged into. The KPC-3 was configured to send power out the DB-25F connector (KPC-3 manual Page 96; "DB-25 Wiring Options: Applying Power through the DB-25 connector").

```
                      Garmin GPS-45
                    Power/Data Cable              DB-25M
                         Brown --------------------> 2

                         White --------------------> 3

                                                +--> 4
                                                |
                                                +--> 5

                                                +--> 6
                                                |
                         Black --------------------> 7
                                                |
                                                +--> 8
                                                |
                                                +--> 20
                                  1/4 Amp Fuse
                           Red -------|~|----------> 25
```

The following is a description of the adapter cable that is used to connect a Garmin GPS-45 to an IBM PC. This assumes the power data cable for the Garmin has been wired as described above. Basically, this adapter is just a NULL-MODEM that has had the power line attachments made to it. The cable above can be plugged into the adapter below, allowing external power to be supplied to the GPS-45, while using a PC to upload/download the GPS unit.

```
                  GPS-54                                 COMPUTER
                  DB-25F                                  DB-25F
```

```

> Overflies Dallas, TX          12:21     8:21   7:21   6:21     5:21

I got this message today from w5rk n-- Ronald G. Parsons
in Austim TX, he is about 160 miles south of the Dallas /Ft Worth area.

He said:
> Don't know for sure if ...  but at 7:25 CDT got
>  KC5EJK>BEACON,RELAY*:[EM12ou] Ion trail
> Did you hear me?
----------------------------

I did not see Ron,  but I did get two packets from
KB5RSY-10   which Ron said was their  WIDE digi  -just a few miles
north of Austin.

KB5RSY-10>RELAY*>ID:KB5RSY-10/R WIDE/D KB5RSY-1/B RELAY/N
    This was the first time I have seen KB5RSY in my Mac APRS station
    log and that logs goes back to Feb 1995

We do not have any HF gate way in the Dallas Area and if Ron only saw the
Beacon around the 7:21 time frame , then I guess it bounced.

I started my 45 Watt -Omni beacon running from  6:30 am CDT to 8:00 am
at a once per min rate.

I was sending :
KC5EJK>RELAY*>BEACON:[EM12ou] Ion trail

and  another DFW APRS users  KI5VM  then set his station to:

KI5VM*>RELAY>APRS:@070633/Happy "Trails"

-----------------
I used the Dallas 146.880 repeater to give a heads up about the fly over
as I scanned the sky looking for the shuttle and
we were able to get reports of the sonic boom as it went from West to East.
We then got a last report of the boom from Nacogdoches, 140 miles
```

South-East of Dallas. I should have given the local HAMs more warning as the few that were on the air had a fun time watching and listening to the BOOM !

We had some clouds in the area and I did not spot the shuttle.

I tried using the internet IP address of 128.2.230.10 and the Cu-SEEme video software to watch the NASA video feed of the ground track, as I waited outside, but the track picture was too small. The Video camera inside the shuttle showed some great landing pictures.

Rendered body type: text/plain

Howdy folks,

One of the larger Hamfests in NE PA was the setting for an APRS demo yesterday morning. K3CSG-5, which has recently received a 7 dBi vertical, performed rather well until air temps. reached near 90 degrees at the site. This was the end of our digipeating, since our rig shut down.

Those of you in Southern EPA may hear it off of its first WIDE at times.

321. Re: [APRSSIG:2888] Re: Mobile

From: "Daniel G. Morgan" <kml@conknet.com>
Date: Mon, 08 Jul 1996 06:21:16 +0000
To: aprssig@tapr.org
Message-ID: <31E0A8DC.521F@conknet.com>
Rendered body type: text/plain

To Roy N5TAM and other KPC3/GPS45 users.

I run the KPC3/GPS45 as a mobile standalone tracker and have provided power to the units from the auto supply by running three cables into the DB25 connecter that plugs into the back of the KPC3 (**making no modifications to the KPC3).

Three cables as follows:
1) auto power +/- leads
2) GPS45 power/data cable
3) short (4 inches) 2-wire with KPC power jack connected to it.

Connect together the (+) power from the auto power cable, the red of the GPS and the center pin of the KPC jack inside of the connecter shell. The data cable brown to pin 2, white to pin 3 and black to pin 1 or 7. Ground (-) from the auto and short KPC cable also to pin 1 or 7.

This sounds like a bunch of stuff, but works out slick! Use the power jack that came with the KPC3, it is the right one, there are at least two other sizes that look like they will fit, but check first for the right combo of id and od of the pin/shell.

```
**If you make the mod suggested in the KPC manual on page 96, you will
supply 13.8 Vdc from the auto a to the 9v internal battery (if
installed). This is not good!! No warning about this in the manual!

   Good thing about wiring out of the DB25 into the external jack is the
battery will be out of the circuit as long as the plug is in. Then if
you use the KPC portable in another setup you can get the battery back
when the plug is removed from the KPC3.

My military unit has 30, yes 30 Trailblazer M's (with Military Grid Reference
System MGRS) our experience is:

1.  M does NOT ahve 99 KNOT llimit, we use them in Apache Helicopters.
2.  Only about 4 hours! (unfortunately) of battery life (3 AA batteries).
3.  We bought these because they were cheap, had MGRS, detachable Ant with
holder included.
4.  Worked well all over the world.  II've added Paccomm/Trimble ant and it
is awesome, but the magnet can't be used in aircraft.

```
In the MAPS-CD.TXT file in the readme directory the following is listed:

"USGSMAP1.BAS:  This is a modified version of MAKEMAP1.bas by Dan Reilly,
W4NMK in North Carolina which will work directly on USGS files obtained
over the internet.  Get these maps from:

http;//edcftp.cr.usgs.gov/pub/data/DLG/2M/{area of interest}
      /{transportation/hydrographic/political/railroads}/

Chose the area of interest and the features from the menu.  You will then
generate ROADS.GRA, WATER_BO.GRA, STREAMS.GRA, POLITICA.GRA and RAILROAD.
GRA.  Combine these all into one file.  One way is with the COPY command:
```

```
Copy ROADS.GRA+WATER_BO.GRA+STREAMS.GRA+POLITICA.GRA+RAILROAD.GRA
ALLSTUFF.GRA"

I looked in this area and could not find the "GRA" extension files. Has
the data changed since this was written?

I don't think, in fact i know this is not the case anymore. They have
changed file formats for the 2m files and at least i have made several
attempts to use  the new format with 0 success. Thankfully i still have the
old files for my state.

There has been a change. I person (the name is at home) wrote a QBASIC
program that is available on the TAPR server called NU_2MEG.ZIP. I have
used it to make about 70 maps and it works pretty well. The only problem
that I know of is that, after the map is made, you have to make a small
adjustment to the longnatude is there is some error in the conversion from
USGS to APRS format.

If you only need one or two maps I could probably whip them out for you.
Contact me direct at "dkaplan@pionet.net". If you would like to take a look
mat some of the maps I have made using this program download "NEMAPS01.ZIP"
from TAPR upload directory. There are 30 some maps at the 32 mile rage as
well as a State map the has all counties shown.

```
I am seeing a good plot of the Hurricane, but I notice that the format is
written as
           085^095/982/115&200
but it should be written as
           085^095/982>115&200

WIthout the > symbol, the 115 mile radius of maximum HC winds is not
being plotted.  I dont know if this is a one-time typo, or UYR is doing
this conisitently.  Can someone get to him?  My mailer just will not work

338. DFjr question

From: William Nolle <ke4eer@worldnet.att.net>
Date: Mon, 08 Jul 1996 18:42:47 -0700
To: aprssig@tapr.org
Message-ID: <31E1B917.6DEF@worldnet.att.net>
Rendered body type: text/plain

```
Several times now i have attempted to find out what size connectors the DFjr
has so i can order the correct once for a juntion box i am going to make.
Agrelo is to busy to answer my questions :-( (I guess i have to many). The MPA
 adaptor has input for GPS (What size connector) because i noticed that it
comes in 3 flavors, Also the power connectors used in the DFjr, also 3 flavors
available. Now some of these look the same but OD and ID are very important.
And since all DFjr owners are going to want to know it would be great for
somebody that has the inside information to post it here PLEASE!.

I have uploaded my final,final,final DFjr quick reference card file to
Tapr. Per a request i added a format the Mac can handle. The formats now
include the following EPS,GIF,PCX,TIF if you can't handle that you have
problems Hi. Not only that the file is getting so big *How big is it)
well it's now 352.650 bytes for a simple quick reference card for your
DFjr to put on your sunvisor of your car, that's as big as some of my
maps files :-)

340. HF Packet transmission length

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Mon, 8 Jul 1996 19:47:11 -0700
To: wb4apr@amsat.org
Cc: aprssig@tapr.org
Message-ID: <199607090247.TAA27112@poseidon>
Rendered body type: text/plain

```
Hi Bob,
   Just occured in Uplinking lengthy S/V posit reports, they tend to bunch
up, and APRS HF side tries to send all in one lengthy packet. Know that
long packet bursts on HF go uncopyable and are lost. Only the shorter length
2-3-4 second ones seem to get through.
   Any way of programing the HF side, to only send short 180/256 bit sized
packets at a time, and in sequence if a large number to send, depending on
how many stored in a outgoing send buffer. Possible could help getting
more HF packets readable.
   I sit here watching KAM+ , HF side, good strong HF packets, good S-meter
reading and steady RED light, yet none print out, especially longer ones.
Lot packet info on air, but just does'nt get GATED to VHF side or even
copied on bottom line of APRS. Short ones can bearly hear, appear on bottom
line of APRS, but not gated to VHF either.
   Strong static crashes I know kills a lot of the HF packets. But the long
time wise lengthy ones are useless..
   Your Ideas, opinion desired. Thanks.. How bout some uplinks of Yachting
Acadamey boats, in Eastern US. We gotta get these Yachts man into APRS.
   TRANSPAC, race to Hawaii, from Los Angeles, San Diego started today,
but I queered Southern Calif, but no APRS activity on that race.

Rendered body type: text/plain

Someone might also tell UYR that digi via LUS is fine but if one
does not hear the digi the data will not gateway to vhf.
I often hear UYR better direct but the call in the path stops
the gateway from passing the position on to vhf.

I am using the MFJ1278 with MacAPRS with no problem. I am quick to note
that I reset the TNC (including yanking the jumper to the backup
battery) before starting.

Everything else was 'plug-n-play'. (But then.. It IS a mac. :))

Does anyone know where I can find PIN diodes? I know that this isn't really the proper place for such a request, but it's the only place I check regularly..

I nned them to make one of the "double ducky" direction finders. From what I can tell, there isn't anything really critical about them, other than I want some that are good for ~500 MHz.

If someone has a few suitable ones in their junk box, I'll gladly buy them.

APRSdos REPLY COMMENT: Check his PARITY setting.  It must be NONE.
In old versions of APRS the command PAR 0 is in the SYSTEM\INITTAPR.TNC
file and should be changed to whatever your TNC needs.  In later
versions, I left this out so you can set it to anything you need..

Yes i found that, but how about the GPS into the MPA board connector?.
Like i say i checked and that comes in 3 sizes all with different OD and ID
and if the center pin isn't just right it will not make good contact. Also i
would like to have spares (So why not list those in the manual)!.

Bill,

Too busy to answer questions! hmmmm....*I* though it was ok to take a few days off for
the holiday;-).

So far Bill, your the only person that has ever asked these questions, and I think
it's because the DFjr comes with all the nessesary cables, connectors, and jacks.

Well Bill..now that at I know you have questions, heres the answers.

                                                                Mating Plug O.D.(mm)            Center
pin
                                                                                                Dia(mm)
Length(mm)

DFjr power jack         Mouser Part# 161-201    1.3mm           3.4mm                           1.2
5.0
DFjr audio jack         Mouser Part# 161-2501   2.5mm/mono      N/A                             N/A
N/A
DFjr modular jack       Digi-Key Part# A9031-ND 6-6 Low Profile Modular Jack, PC Mount
MPA GPS jack            Mouser Part# 16PJ031    2.1mm Power     5.5MM                           2.0
9.0

PS-I had to make a special folder just to keep all of your questions in.
I will add this info to the manual.

To go into GPS mode, you'd have to power the kpc-3 off and on *after* the ARS restore file ran. I think there is no way to do this step with a command.

When starting back up, you would have to hope that APRS could send 3 appropriately spaced control C characters and that everything would continue on properly while (and after) the KPC-3 sent its initialization (power up) message to APRS when it recognized the CTRL Cs.

Then you would need to make sure that the BLTtimer got set to zero, otherwise you would still be sending tracker position reports with bogus info in them after you started APRS.

And don't forget you need a t least a toggle switch or relay to feed the GPS data directly into the TNC when the laptop was gone or you wanted to act like a tracker-

OR

Do what I did: Sell your HSP adapter and get a dual port Pico-Packet from PacComm. The GPS feeds in one port, the computer goes to the other. APRS sends a "refresh" (CTRL E)periodically to the Pico to keep it happy. As long as it has the refresh every once in a while (the LOC ev xx parameter), it knows the pc is there and its built-in HSP will feed location info to APRS.

As soon as you unplug the laptop (or the battery dies), the refresh stops and the TNC becomes a tracker after the LOC timer runs out. You even turn dark gray on the map and your P list entry gains a / sign and loses the @ sign.

This works great and I stay on the map all the time with the TNC and GPS safely hidden out of the way. All I have going up front is the RS232 cable from the Pico.

353. DFjr Cables

From: Joseph Agrelo <jagrelo@cris.com>
Date: Tue, 09 Jul 1996 11:40:06 -0700
To: aprssig@tapr.org
Message-ID: <31E2A786.55BB@concentric.net>
Rendered body type: text/plain

To the SIG,

Please be aware that the DFjr comes with all of the nessesary cables and connectors. William Nolle WA8INZ is trying to make a custom harness to better suit his needs.

Here is a clip from only one piece of email I received in response to Bills posting on the SIG.

Clip!---

I recently seen a message by Bill WA8INZ. He stated that he had to buy some cables and connectors to connect the DFjr to his equipment after receiving the DFjr. Since I'm expecting to receive my DFjr the day before our local Hamfest, my spare time is going to be minimal. I'm a committee person as well as doing some seminars. I wont have hours to play with the DFjr to make all the connections if there's lots to make it work out of the box.   I will be using a laptop, KPC-3, Garmin 45, and my radio will be either an Icom IC2000 mobile or IC-Z1A HT. The club president will have similar equipment.

End Clip!---

Now I will just grit my teeth.

I just went to the local radioo shack and found oone that fit, 3/32 I
think. I'm not sure but I think they are sized by the center pin, which is
on the MPA. Anyway, after I put all mine together, I used electrical tape
and taped it all together so that it wouldn't come loose. You'll have to
do something like that too. (We have lots of "country dirt roads" in these
hills!) Bumpidy, bumpidy, bumpidy!

Rendered body type: text/plain

```
I don't remember anyone mentioning this before, but I got a sales flier
yesterday on this...

Trimble now has an OEM engine to compete with Garmin.  It's called the
"Lassen-SK8".  I'll summarize briefly:

based on "Sierra" technology
8-channel
differential ready
dual serial i/o ports
NMEA 0183, TSIP, RTCM SC-104
accuracy: position = 25m CEP without SA
          velocity = 0.1 m/sec without SA
          time = +- 500 ns
DGPS accuracy: position = 2m CEP
               velocity = 0.05 m/sec
               time = +- 500 ns

Don't have to grit your teeth Joe, i answered that person by private e-mail and
told him what i was doing, and also that the only cable you need in addition to
what comes with the DFjr is an extension speaker. But what bothers me Joe i
have asked 3 times now for the sizes of the MPA adaptor, specially the one for
the GPS (Now that cable a person has to make) but maybe you don't know either,
if so just say so and i will find some way to measure the pin size.

For all the folks reading something into this that isn't there. I am making a
junction box to cut down on the many cables running all over the place when
hooking a DFjr, Laptop, TNC, GPS, 2 Radios, Extension speaker, Power to all
this, this hopefully will cut down on some of them!.

This has nothing to do with the DFjr itself it's working great and will work
right out of the box except for the Extension speaker. So those of you that are
concerned about needing cables, of course you do, but then you always do even
when purchasing a new radio or TNC or whatever. You will need to change the
connector on your GPS if you are using the MPA from Agrelo and that's the one
i'm trying to find the size of.

Ok Scott, i looked at the MPA GPS connector but it doesn't say. Yes i could go
to the nearest Radio Shack but as you know most of those are packages and
can't try and buy Hi. I will measure it somehow, would be better if it is the
right size. Thanks again Scott.

OK, I just finished putting together GAmaps06.zip and posting it on tapr.org
in tapr/SIG/aprssig/files/upload.

It has city street level throughout most of Atlanta.  I will be making some
improvements to add street names to  some of the maps along the Marathon
route.  But I wanted to get it out there now for planning purposes.

The Marathon, Cycling course, and 10K run/walk courses are marked.

Yes i got them but had a hard time printing them out though. You must have your e-mailer set realy wide or no auto justification Hi.

Thanks Joe for the information, now i can order my JUNCTION BOX parts, and make up the cables for it.

This is understood, Kevin and I both digi via W7LUS due to the fact that we are trying to reach florida users with our hurricane data. Since we are in Florida we cannot do this due to the skip range, Peter W7LUS has a good position to reach most of Florida allmost all day long. After we digi thru Peter then GATE,WIDE will get any important data distributed back along all the VHF networks in FL that have a 30M GATEWAY.

Also digipeating is not recomended on HF but their are occasions when it must just be done, this is one of them.

```
>Someone might also tell UYR that digi via LUS is fine but if one

Rendered body type: text/plain

>I have uploaded my final,final,final DFjr quick reference card file to
>Tapr. Per a request i added a format the Mac can handle.

Much thanks for doing all this work. I have the cards all printed out for when I get my DFjr.

I have not had any problem printing any of your early PCX formats on my MAC or the later GIF,TIFF - Other than making is smaller-- :-)

But I did need to use a text editor to remove some extra binary data from the first line of the .ESP file format

I saw this:

```
□-²□¤!¤Ã□□%!PS-Adobe-2.0 EPSF-2.0
%%BoundingBox: 24 503 524 768
%%Creator: COREL DRAW
%%Title: DFJRFRNT.TMP
%%CreationDate: Mon Jul 31 11:37:16 1995
---------------------------------------
```

I just deleted the extra data before the %!PS-Adobe-2.0 EPSF-2.0
with a text editor and it printed fine.

I don't know if that is from the ZIP process or what.
Did others have a problem printing the EPS files.
Was as regular PS file any smaller ??

Thanks again

73

Glad you didn't have any problems printing them on the Mac, notice the
date and time. I did this on my old 486/33 that has a dead battery i
guess. Yes i don't know how it added that info on the end of the file
since all i did was used the export function on CorelDraw to create the
file. Bob i use the PCX and place it into Pagemaker, when placed into
pagemaker it's way to big but it's easy to resize that way. Actually it
was done in CorelDraw as being 4.5" X 7" .

Rendered body type: text/plain

```
Hi,
I've just recently become acquainted with APRS and find it great!  I
would like to make my own maps, however, the information in the various
TXT files is confusing - at least for me as a beginner.  I notice in the
GPS.TXT file the following about the Garmin 45 (which I have and would
like to use to make maps):  "Replay track histories stored in the unit
into APRS conversion programs and build yur own APRS maps."  That's
exactly what I want to do!  Is there a step-by-step process you can refer
me to?

Thank you!

Rob

374. Help with init and restore files for KPC-3?

From: byoung@qni.com
Date: Wed, 10 Jul 1996 14:49:55 -0500
To: aprssig@tapr.org
Message-ID: <9607101949.AA02401@qni.com>
Rendered body type: text/plain

APRS devotees,

I'd like to ask for some feedback from the group on the "optimum" APRS
TNC initialization and restoration files for use with the KPC-3. The
"modes" would include "normal" operation at QTH and (most importantly
right now...) mobile with a GPS in HSP mode. Any and all suggestions
 considered!

Bill Young
byoung@qni.com

Rendered body type: text/plain

Yes, just run MAPFIX23. THen do a TASK-GPS and give the file name of the
Track History, and the dots will apear on the map for you to draw in...

376. GPS Display From J. Goldberg

From: mark.endicott@nashville.com
Date: Wed, 10 Jul 96 16:52:32
To: aprssig@tapr.org
Message-ID: <199607102202.RAA22075@tapr.org>
Rendered body type: text/plain

I recently completed the LCD Display kit that J. Goldberg has advertised on this sig. It parses the GGA sentence from your GPS and displays Lon.,Lat, Time and Grid Square. The kit went together in about an hour and worked the first time.

J. mentioned in the doc's that if there was any interest in having it parse and display other information to let him know. I thought that it would be great to have it parse the RMC sentence and display Lon., Lat., SPEED and COG (Course over Ground) He responded, that if there was enough interest he probably could make it work.

I am using the display with the Garmin GPS-31, which like the GPS-20, has no display. J's LCD display could be mounted on your dash and show Location, Speed (TO 999 KNOTS WITH THE 31 AND 20) and Course as well as feed your TNC the required tracking information.

If anyone is interested in having J. work on this project and would commit to buying one ($50.00); email him direct and let him know. If there are 10 to 12 of us that want one he said he would "work on it".

APRSdos REPLY COMMENT: Simply load the map you want to modify into MAFIX23 and then use the TASKS-GPS command to load the track history. The dots will show on the map and you can edit new roads over them...

These are APRS track history files. TO take the data out of the GARMIN, I believe someone wrote a conversion program from GARMIN to APRS format... Anyone?

Rendered body type: text/plain

Thanks for the help finding Peet Bros. Now some new questions. Is the 500 supported as well as the II and 2000? I have a PK-12 now which understands GPS and Ultimeter II streams. When I connected it to the GPS20, it seems to just spit out the sentence exactly as the GPS sends it - i.e. with no processing. I assume it does the same for the Ultimeter so it is really up to the APRS software which receives these sentences to parse them. Correct? Also, the instructions in the PK-12 manual for the Ultimeter hookup say to add the time and date to the beacon text. Does it alter that information or just leave it alone (I'd guess the latter)? If it leaves it alone, it doesn't seem to make sense to put in a time/date stamp when the system was setup - I'd want to know the time/date for the readings. Am I missing something?

I'd prefer to run this standalone without a computer so any other info from those of you who have done this would be welcome. Now the big decision - do I really need the barometer in the 2000?!

The latest APRS is posted as APRS76f.zip, but not yet the upgrade file. Ill do that tomorrow...

it fixes:
1) the own wx station wind direction display
2) the new Ultimeter formats
3) It has the alt-SETUP-OTHER-LOCK command that will allow you to lock the program from sending any mnessages, objects, or other data. This is for un-atttended operations to prevent un authorized individuals from putting sdata into an APRS newtowrk un supervised...

I have three KPC-3's, one at the QTH, one in the mobile package, and one
as a digi. For the exception of the digi (btext, BT every 10:00, ect.)
they are all the same, with different id's -10 digi, -15 mobile. I use a
Garmin 55 in the mobile package with the DFjr Multi Port Adapter (MPA)
now. I was using the HSP that you mentioned with excelent results. All the
setting were the same as the QTH tnc.

If you find a more optimum mode, let me know!

385. KPC-3 question

From: Doug_Wetzel@acs.uswest.com
Date: Thu, 11 Jul 1996 08:13:01 -0500
To: aprssig@tapr.org
Message-ID: <1e50d2b0@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

I have seen a number of postings stating that the KPC-3 can use the MYNODE
callsign as a digipeat alias. It's not clear from Kantronics' documentation how
that alias becomes enabled as a valid ax25 digi. I have the MYN callsign
programmed into our WIDE, but when directing a path at it, it does NOT digi.
The KA node function IS disabled. Anyone done this and can help?

Please reply direct and spare the sig bandwidth! Thanks!

Rendered body type: text/plain

Hi.. Real quick.. Yes.. MYNode can be set up for WIDE and will digi, but the
Node must be set active with NUMNODES command.. Usually setting it to 2 would
be good.. Hopefully that will work..

Hi..

I am getting started into APRS. I have a KPC-9612. I would like to set it up
and was wondering if there is any 9600 APRS action anywhere.. Either 2m or
70cm.

I will be testing it with GPS and moble soon.. So I am sure I will have
questions on that too.. But none right now.. If you have any advice.. Please
let me know.. Thanks!

I would second that and underscore the value of posting whenever we have good, positive experiences with companies who supply equipment for our hobby as well as the negative experiences. Peet replaced my U2000 whose LCD had failed, without question and promptly.

And I just purchased a unit for a friend in the UK, and they configured it for 220v. He called me, 'ecstatic' over it!

Doug,
Here are the parameters we're using for WA9CJN-15 Wide-Relay. It's a KPC-3.
We're also extensively using the Remote function, as the digi site is quite removed from my QTH. Note: I've deleted the RText and MYRemote. Check the KPC-3 docs for further info.

390. APRS76F and MAPFIX26

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 11 Jul 1996 12:39:31 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960711123328.17194A-100000@arctic>
Rendered body type: text/plain

I had left out the new MAPFIX26 in the APRS76F.zip that I posted after
midnight last night. I have now uploaded a new APRS76F to tapr. If you
donwloaded the full APRS76F prior to 1220 EDT Thursday, then you need to
get the upgrade file 76to76F.zip. (there were several other new files
that were also left out, so please get the upgrade...)

MAPFIX26 fixes the problems introduced in MAPFIX25 whenever you delete
the END point of a map feature. As you know, beginning with MAPFIX25 you
can now use the MOUSE and I find that VERY handy! Please delete all
copies of MAPFIX25. Thanks.

HERE IS A LIST OF CHANGES IN DETAIL:

Following changes in 76f:

WX changes:
* Fixed to operate with new format Ultimeters +4 and +8 bytes
* Fixed bug preventing OWN station WX wind direction from plotting

* For un-attended displays, Alt-SETUP-OTHER-LOCK prevents unauthorized
  casual users from SENDing, INPUTing, and COMM-TNC access

GENERAL:
* Fixed 6 letter calls & 2 digit SSID's not receiving MSGS or ACKS

SPACE MODE:
* Eliminated the old APRS grid Square mode which put the GS in your BText
  in favor of the current system used in SAREX, APRtrak and MScatter
  where the GDSQ is put in the TO address. APRS will still receive the
  old format, but will not transmit it.
* Now, the special format]$[at the beginnning of a packet will force
  APRS to interpret the TO field as a GRID Square AND the $ character
  will be interpreted as your symbol character.
* SPACE & Mscat modes have moved from the SETUP-MODES to SETUP-FORMATS menu
* Now SPACE and MScatter FORMATS automatically insert this symbol indicator
* SPACE FORMAT now only configures your station to TRANSMIT with your
  grid square in the TO field. It does not automatically increase
  its beacon rate when it hears the spacecraft.
* To have your station reset its decay timers on hearing the spacecraft,
  now you must select the SETUP-MODES-AUTOspace mode.
* Fade-to-Gray is disabled in SPACE and MSCATT modes
* SPACE and MSCATT modes now capture the entire packet on the ALL screen
  so you can see the TO call of SAREX packets.

Ver 76e: Fixes these problems:
* APRS has always forced TXD of 33 when in HF. This has been removed.
  Set your TNC TXD as you like or put it in the INITTAPR.TNC file.
* The SPACE mode SUCCESS function was not working in all versions as far
  back as I could find. Therefore your station would not RESET to a
  low BEACON rate when you were successful. This would cause un-necessary
  QRM during APRS SAREX operations. Is now fixed.
* I think I fixed why APRS often sent the first packet via RELAY instead
  of what you had in your config file...

> >Bob: Wonder what the difference is between Lock command on 76f and the C
> X command, where u can turn off the transmit on the older versions?

APRSdos REPLY COMMENT: With LOCK set, APRS is still fully functional on
line, reporting its position and latest status, plus trying to deliver
and ack its messages and bulletins. But with LOCK set, you cannot ENTER
any new data for transmission.. Nor alter your position or BEACON STATUS.

It keeps unauthorized personnel from messing with the data going out over
the net while still permitting full operator access to all displays and
screens...

Just a note to relay an experience I had with my DFJr from Agrelo Engineering ... After assembly and hook-up, all appeared to be working except that bearings to the transmitter were very erratic, mostly invalid. I played around with the unit for about 2 weeks, trying this and that, but no joy.

I e-mailed Agrello engineering, and described my problem. Joe responded by e-mail, apologized for the troubles, and said they would send another antenna/switching unit to replace mine. I answered with a request that the antenna/switching unit be replaced before 4th of July weekend. They shipped the replacements 2nd day UPS, and I received on July 3rd.

Had a chance to try it out, and all is working fine now. Got a fox hunt this Sat., and I'm sure glad to get it corrected. :-)

Thanks to Agrelo Engineering for the customer support.

395. Trimble/PacComm GPS Antenna Report

From: Claude 995-5040 pager 4541 <CHEAD@exame2.dseg.ti.com>
Date: Thu, 11 Jul 1996 14:04:40 -0500 (CDT)
To: aprssig@tapr.org
Cc: CHEAD@exame2.dseg.ti.com
Message-ID: <960711140440.2081a42a@exame2.dseg.ti.com>
Rendered body type: text/plain

I borrowed one of the Trimble/PacComm GPS antennas from Jim, AA5QX, with the idea of comparing it to the Motorola active antenna I have been using for about the last nine or ten months. The Motorola antenna has always been an excellent performer and I have been quite happy with it. It is mounted on the dashboard of my '94 Chevy Caprice. I glued (rubber cement) the top of a tin can to the dashboard right next to the windshield and on the centerline of the car. The Motorola antenna was placed on the tin can lid to keep it from sliding around, since the dash is all plastic (read non-magnetic!). I run a Garmin GPS 45 in the car.

The Trimble antenna was placed on the dashboard a few inches away from the Motorola antenna and tied down to the defroster vent with a twist tie to keep it from sliding around. I used it like that for a couple of days.

I was really quite disappointed in the Trimble with this setup. Its performance ranged from mediocre to unacceptable, sometimes not seeing any of the satellites at all even with an unobstructed view of the sky. It also seemed to be very temperature sensitive. Bummer!

However, this morning I got to wondering if a real ground plane under the antenna would make any difference. I cut the top out of another handy tin can (about 2.5" to 3" in diameter) and put it under the Trimble, leaving it in the same place on the dashboard as before.

WOW - what a difference! The performance now ranges from excellent to outstanding, I think generally outperforming the Motorola. However, I have only used the Trimble like this for a few hours and today in Dallas is pretty cloudy, so the temperature in the car has not been extreme today so

far. However, I have been impressed enough with the Trimble to put in
an order for one of my own!

Moral of the story. The Trimble antenna REALLY DOES like some metal under it.
This makes an enormous difference in how the antenna performs. If you are
trying to use one without the ground plane, you are only getting a small
fraction of what the antenna can do. Even something as simple as a tin can lid
makes a huge difference.

Point two: Jim Lawyer, AA5QX, has developed a really elegant process for
mounting an ordinary BNC connector in place of the SMB connector which comes
on the Trimble. The antenna I was testing above had the BNC connector which he
had installed, so it plugged directly into the Garmin GPS 45 with no trouble
at all. Maybe with a little encouragement from the SIG he could be persuaded
to detail the steps of this connector replacement for us!

Hint, Hint - Jim!!!

Hi
Tomorrow I'm heading to a hamfest about 3 hrs. from here (Winnipeg) and
will be taking a borrowed laptop and the Paccomm Tiny 2 TNC with Trimble
GPS board installed which belongs to the University Radio Club here. One
of the other members added some parts to create the HSP switch in the
TNC. Makes for a handy mobile setup.

I just want to make sure that I will be able to track myself as we travel
down the highway. Other than HSP mode I don't think anything else is
needed to be able to accomplish this. There will be no radio attached to
the TNC (no APRS traffic here yet :-( ).

Thanks in advance for any suggestions.

Boat/ U.S. has a device called SkyScan which the add says will detect
lightning 40 miles away. Price is about $200.

I watched one in the store, here in central Florida, during an approching
storm and it seem to work well.

Any GPS with NMEA output will do. I have an aviation model Garmin 55 AVD.
These are *very* expensive, but I take mine out of the Blazer and into the
plane on weekends. There are several that have purchased non-display types
that I assume work just fine and are of course much more affordable. It
all depends on your intended use. Do you want to keep it as a "dedicated"
machine or use it elsewhere.

Good Luck!

Many thanks to all of you who responded to my mynode alias question.  Setting
numnodes to 1 did the trick!

Now, does anyone have a quick and dirty circuit to match a low-z tnc output to a
hi-z mic amplifier input?

TIA

OUCH! That's a bit steep!

OK, twenty questions......how was it displayed? Was it a monitor? Built
in? On a computer sreen? What was the interface? NMEA? ect. ect.
(Well, not quite 20 questions..)

Im referencing Dos Tech ref 1983 version 2.1

Dos function calls return error 6 meaning Invalid file handle.
Within Dos there are critical errors (The ones that generate
Abort Retry Fail
messages) and have to do more with hardware. Here error 6 is
seek error (using disk)

Rendered body type: text/plain

Ok I give up. I need help. I have a KPC-3 hooked to a laptop running APRS76.
Initially every thing worked fine. Now everything seems to work fine except
it won't plot gated positions on the map. The position of my
ht,KPC-3,laptop shows up fine.
It transmitts the position fine. It appears to receive the gated positions
from my 30mtr/145.79 gate fine, it just doesn't plot them. What did I screw
up? any help would be appreciated.

Try    C    F     H       you may have inadvertantly turned HF mode
off and that is why it will not show gated plots on the map.

>  a externally powered pre amp with my h/b antenna.

This should work...

\                      Cap                       /
-|---------------------||----------------------|-
/-----------------------------------------------\

Put a capacitor in line.  At these frequencies, just about any small one
should work.

Anyone know if the Radio Shack DC blocker works at these frequencies?

437. question about maps and lists

From: KD4EMI@aol.com
Date: Sun, 14 Jul 1996 20:33:30 -0400
To: aprssig@tapr.org
Message-ID: <960714203329_576648096@emout07.mail.aol.com>
Rendered body type: text/plain

I have the FLMAPS02.zip file...Ive unzipped the maps and replaced some of the
same file name old maps with the new ones...

Then, I looked at the other maps of disney and cape canaveral etc...
I would really like to use these as well.   Here is the confusing part for
me.

Do I include all of these in MAPLIST.USA or do I make a state maplist .
How does the program go to the state maplist...does it look at the USA
maplist...Im confused...

I think !!   I make a maplist FL then put the maps of florida on that list.
Then what do I do to maplist USA ? DO I change it too...?

Also, who made those incredable maps !! It says they were made by CD but who
acutally did it.. Id like to thank him/her

Also CUDOS to KD4UYR who kept us all informed about hurricane BERTHA when it
approached FL.   It was neat to see alot more APRS stations come on line just
before the storm !! The state was filled with them... I only had to look at

my computer to tell just where Bertha was ! KD4UYR And (W7LUS who provided
the digi back into the state) did a great job....Well done...They came
through !!

I also had a great HF link to KP4DDB and HH2B (Puerto Rico and Haiti) and
monitored their weaher sensors !   Cool !!

Mike

Here's what the directory on my desktop machine looks
like after I copied the cdrom files for Georgia. PM works
with this setup. I don't have a laptop yet (one's been ordered).
I did this on the desktop to see if it would actually work.
I did this before this subject came up here and did not call
tech support.   This is all my own doing.
Note that the CDROM map data is in the PMAP dir and
the actual programs are in PMAP2W.

```
[E:\pmap]dir

No Mike leave the Maplist.usa just the way it is and make one for Florida.
Maplist.usa is the first maplist it will look at unless you configured it
otherwise.
>
> I think !!   I make a maplist FL then put the maps of florida on that list.
> Then what do I do to maplist USA ? DO I change it too...?

>

In order to then change to your Florida maplist just do an M-C and enter the extension of the Florida maplist> Example lets say you named the maplist FLORIDA.NOR you would type M-C then NOR and it would load all the maps in that Maplist. Remember though that you are only allowed to have about 160 maps in each maplist.

Yes i also loaded Bertha's information onto the map for the South East and updated the information whenever it was updated on the internet site. Hope this helps a little Mike.

> KD4EMI@AOL.COM

Thanks for the compliment Mike....at least this year there haven't been as many as last year.....yet....but it is a lot of work to track the hurricanes including forecast positions....and if anyone would like to volunteer to help...I am all ears and antennae..

And regards the maplists.....you have two choices.....one is to add the FL maps to the maplist.usa....but they must be put in descending order....or create your own

```
maplist...or add them to maplist.se....you can switch maplists at any time during APRS
operation using the Map-Changemap command.....and you can use any of the maplists as
your startup maplist by saving your config file on your registered version after
choosing the alternate map......you are only stuck with maplist.usa on startup if you
are not a registered user.

Hope that helps and 73

de Kevin KD4UYR...working on my mail server...hope this one gets through

444. WinAPRS 1.1.2 released

From: Mark Sproul <sproul@ap.org>
Date: Mon, 15 Jul 1996 10:55:32 -0400
To: aprssig@tapr.org, winaprs@tapr.org
Message-ID: <v0300760bae1009ae14fa@[165.1.27.20]>
Rendered body type: text/plain

```
To all WinAPRS users

I have just realeased Version 1.1.2 of WinAPRS. I recommend all upgrade to
1.1.2 as soon as they can.

Thanks to hasan schiers, N0AN, who helped me track down some specific problems.

Bug fixes
```

```
        Problems with dual port TNCs (PK-900 Kam plus) have been fixed

        Some weather releated upating has been fixed

New features
        In the MESSAGE LIST, there are 3 buttons at the top of the window

        ALL MESSAGES     BULLITENS ONLY     MY MESSAGES ONLY

        I think you can figure these out

I am still working on the HSP stuff, I promise it WILL get done, the serial
code is just a major pain to get working on BOTH Win95 AND Win 3.1 at the
same time

There are TWO files on the FTP sites, W112UPDT.ZIP is just the updates and
DLLs, WAPRS112.ZIP is the full distribution including maps.  If you are
already running WinAPRS, just download the update file.

side note:

It appears that my humor has been missed by a few people, the default call
sign for WinAPRS is N0CLU, this is NOT a valid call.  The call sign stands
for

        NO CLUe

Apparently someone in the midwest was trying to send a message (via APRS)
to N0CLU to tell them that there lat lon was set incorrectly.

Hasan, did you happen to notice who that was??

Mark

One source is:

Pasternack Enterprises
P.O. Box 16759
Irvine, CA 92713-6759
(714) 261-1920

...but they ain't cheap (~$25.00).
...I suspect that there are less expensive (?lower quality) sources and I'd
be interested as well.

For the moment, I've got one "kludged together" with an SMB circuit board
mount, short piece of RG-58 soldered to the SMB mount with a BNC connector
on the other end...works but it's "ugly".

BTW: the antenna is great!!

  About a month ago I dropped by "The RF Connection" on Frederick Road in
Gaithersburg, MD, and bought RG-174 to male and female BNC connectors.
The wire on the Trimble is larger than RG-174, so using a micrometer I
chose the correct drills to slightly enlarge the holes in the rear clamp
and an internal plastic sleeve in the BNC.  It was easy to put together,
and the best part was the $2.50 price per connector.
  Sorry but I don't have the type number of the 174-BNC connect at hand
at the moment.
  BTW, these were the easiest-to-assemble clamp BNC connectors I've ever
seen.  The internal plastic sleeves made avoiding shorts very easy.

Yes, I have that set and it still fails to replay tracks.  I also
     updated to the latest version of winaprs (1.1.2) and have some sort of
     glitch with the icon display (displays as a bar across the entire
```

screen no matter what icon I select). If I click to turn icons off
nobody displays on my screen. I'm running 3.1 with win32s and that
might be the problem (?). I will try on my windows 95 machines at
home.

73

Hi Ian...I had the same problem...let me explain how to do it.

1. Make sure there are "tracked packets" shown. Not all stations on the
   track list necessarily have "track packets" received yet. You will see
   the number of packets and track packets displayed separately on the
   Track List. You also have to have checked "autotrack moving objects"
   in the Setup Menu.,

2. On any map screen where the station you want to replay shows up, single
   click on the station to highlight it. (Get down to the detail level you
want

   ahead of time...if you don't, you have to re-highlight it. The station
doesn't
   stay "hooked" when you zoom the map.

3. Go to the "Display" menu, and at the bottom is a selection for Replay
Track.
   Click on it and away you go.

If no station is highlighted or there are no track packets, nothing
happens.

>a tin can lid makes a huge difference.

I can verify this...a reflective metal surface is required for proper
performance of the antenna. It is works, very, very well under those
circumstances. I have even considered putting it on top of my black jack
antenna ...but think it may be made of aluminum stock, so may not stick.

If you are running FSK, I don't have a clue, if AFSK, you would want
10.151 LSB, 170 to 200 hz shift (200 is most common) and since you are on
ssb with afsk (if true), the tones themselves don't matter if they are in
the passband of your radio. 73,

The end of the Trimble is female.  You need a male SMB, also called a "jack."
The Pasternack part for BNC male >> SMB jack is PE9132 (cost = $25.95).

Hope this helps.

OK, maybe the doc's explain, but I was not able to find easily.  What do you mean by
descending order, Kevin?  I had added a map to Texas (maplist.tx), and it said it was out of
sequence, or something like that.  HUH?  I did not quite understand.  Again, maybe I have
not dug down deep enough in the doc's but, would you mind shedding light on descending
order...

Rendered body type: text/plain

Any of you ladies and gentlemen interested in running another APRS meteor
shower test during the upcoming Perseids meteor shower. The predicted peak
of the shower is August 9-10, so we could run the test for a 36-hour period
(August 9 0000Z to August 10 1200Z).

Last year, the results were impressive even with relatively low
participation. If more stations participate this year, it could really be
interesting.

Since this is my big idea, I'll volunteer to receive, compile, and publish
the results (unless someone else steps forward).

Any interest? Comments?

Stan, WA1LOU

Rendered body type: text/plain

I use it on N4NEQ-8 up in the mtns on N GA. The wind and temperature have to be just right in order for the moonshine to be worth a toot as it comes out of the still.

I plugged the U-II into the KPC-3 using a "gender bender" that converted the female DB25 on the U-II into male DB25.

I set up the KPC to think it was connected to a GPS, with the # symbol as the Gpshead number 1.

I set The path (LTP 1) to be what I wanted and set the interbla (BLT 1) to 9 minutes.

I set the Btext to be my lat/long (like in a digi) with a comment about where the unit is and a message for the revenooers to keep away.

I set the Beacon timing to be every 20 minutes.

Everything works fine except for this (Bob are you listening?): The icon as seen on APRS sometimes seems to change from the WX symbol to the dot, which is what I used as a symbol. You have to play with the beacon timing to find a happy medium.

I think that's all I did that was special for an U-II unit.

I just cut mine off and installed a RG-174 coax BNC connector on the end. I purchased the connector at an electronics store. I got the solder on type. I had to slightly drill out the hole for the cable to fit in, but it works great. With less loss to without the adapter.

OH Dale, do read the docs that come with the program.....maps in the maplist must be in
order from largest to smallest overlapping map or they won't show up as you zoom in to a
specific area.....take a look at the list....it starts with World.map, followed by
USA.map etc....so if you have a county map of your area and then a city map and then
your subdivision map...they must be put in that order on the maplist....

Just a quick note, without flamage, to those composing their notes on a word
processor, thence flining them out to the group.

Those of us who still use unix systems and the mailers we're most familiar with, find the small-point fonts distracting at best, as they make for one 80-character line, then, say, a 7 character line. I would think it possible to reset your word processor for 10 or 12 pt font, and send something that populates a line out "normally."

While I'm at it, I wish to add my voice to those who prefer to NOT receive MIME attachments on this list. I have a security practice of dumping all MIME attachments unread, unless they are from someone I know, who alerted me to the attachment in prior mail, and who tells me what is in it. 5 years involved with CERT team activities was enough to convince me!

Thanks, & 73,
gerry

There is a setting in the APRS SETTINGS dialog box AUTO TRACK STATIONS,
this must be set to on in order to track stations

As of 1.1.2, the default is now ON, it used to be OFF,

Mark

Here's what we did last year (from Packet Perspective, October 1995, QST). The only changes I suggest are the dates/times (August 9 0000Z to August 10 1200Z instead of August 11-15) and who to send your reports to (me or another volunteer, rather than Bob). Please comment on these changes and/or suggest other changes and I will finalize our plans ASAP and make announcements everywhere:

"All amateurs are encouraged to participate in a Perseids meteor scatter test August 11-15. Although 6 meters is better than 2 meters for meteor scatter work, everyone has a 2-meter radio and we can make up in numbers what we lack in performance. All you need is a TNC and, preferably, high power and a beam. The objective is to see how many grid square (DX) packets you can receive over the four-day event.

"Stations in the four quadrants of the country will transmit alternately for 15 seconds. Stations can transmit the shortest possible meaningful packet formed by placing their six-digit grid square in the Unproto To call sign field, for example, WA1LOU>FN31MP. The suggested frequency is the ARRL experimental packet frequency of 145.79 MHz; suggested procedures for the test follow:

"1) Point your beam towards a major population area 500 to 1000 miles away in one of the other US quadrants. If there is another active local station, coordinate your beam headings so you are not both hitting the same azimuth and receiver target area.

"2) Enter your grid square into your TNC using the following command:

```
cmd: UNPROTO FN31MP
```

where FN31MP is your six-digit grid square. If you can't estimate the last two digits, use AA. Note that no Via Digipeater is used.

"3) For attended operation, enter the Converse Mode (cmd: CONV). Each time you hit carriage return <CR>, you will send a packet. Hit 20 <CR>s and you will send 20 grid square packets. Synchronize your clock with WWV and transmit as many <CR>s that you can according to the following schedule:

"Northeast stations transmit between 00 to 14 seconds of each minute.

"Southeast stations transmit between 15 to 29 seconds of each minute.

"Southwest stations transmit between 30 to 44 seconds of each minute.

"Northwest stations transmit between 45 to 59 seconds of each minute

"4) For unattended operation, set your Beacon Text to HP where H is a single character representing your beam heading divided by 10 and expressed by the digits 0 to 9 and then A to Z (9=90, A=100, B=110, C=120... Z=350). P is the square root of 10% of your power (1=10, 2=40, 3=90... 9=810). Set your Beacon to Every 1. This is not in accordance with the scheduled 15-second cycle, but it is better than nothing if you are operating unattended.

"5) Alternatively, run APRS version 7.1b or later, which has an automated meteor scatter mode, which will plot received packets on a map. In many areas, 145.79 MHz is already being used for APRS.

"Meteor scatter paths are very specific between the transmitter and receiver. Typically, any single event will be heard only by receivers within a 20-mile footprint. That is why everyone can transmit at the same time in the same area, preferably pointing their beams in slightly different directions. As long as there is approximately 50 miles between identical transmitting stations, their signals will probably not hit the same receivers at the same times.

"W0RPK and K1HTV made a successful 2-meter packet meteor scatter contact

in 1984 over about a 1000-mile path, but it took 2.5 hours! Hopefully, by
having hundreds of transmitters and hundreds of receivers, we can improve
the statistics.

"Since you will possibly see packets that no one else will see, send all
grid square reports known to be greater than 250 miles distant to
WB4APR@KA3RFE.MD (via packet) or bruninga@greatlakes.nadn.navy.mil (via
Internet) and Bob will compile the data. Be sure to include your grid
square."

FYI, folks....

Anybody mobile in the Kansas City area this weekend is invited to attend our monthly KCAWG meeting. Meeting will be held on Saturday, July 20, 12:00 noon at Tortilla Flats Mexican Restaurant, 5800 N. Antioch Rd., Gladstone, Mo.

Talk-in on 146.79 repeater (voice)...

Excellent food, questionable companionship (a bunch of them APRS crackpots, you know) and a splendid time is guaranteed for all ([Cockney accent follows] Thank ya, Paul...)

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator
EMail: ku0g@sprynet.com

Rendered body type: text/plain

OK, I'm baffled!

I'm running a U-II Wx station with the TNC on Com 2, and the U-II on Com 1.
APRS Ver 76D

```
Everything SEEMS to be running fine except ALL packets, including mine,
monitored at the bottom of the screen, are preceeded by
No>:

But they still register with the program (ie., map, p-list, h-list, etc).

When I stop the program and restart it as just APRS (no WX), everything
works great! Add, New, Bcn, Pos.  Even though I still have the U-II in Com 1.

Anybody got any ideas why this is happening?

Thanks and 73s

> Do I include all of these in MAPLIST.USA or do I make a state maplist .

APRS ANS:  You dont modify MAPLIST.usa, that is my distro list.  You may
make modifications for your own use, but do not distribute it since it
will confuse people.  MAPLIST.USA lists all maps included in the basic
APRS distribution.

MAPLIST.SE lists all of the maps distributed in the SEmaps11.zip file,
also my responsibility.  Your MAPLIST.FL should list all of the
FLmaps02.sip maps plus all larger maps that include florida....  But your
FLmaps02.zip should not include copies of any of these maps that are
already in APRS or in SEmaps.  If you fix or modify any of those maps,
then you have to feed the changes back to me for my distribution.

The idea, is that for any one map, there should be only one source, and
modifications must be made at the source, or you will continue to get
re-distributions of an old out of date map.

I don't think I ever announced it here, but a couple month ago, when Bob
asked again for someone to take care of such problems, I took the duty.
I'll be able to do that for maximum 2 more month, after what I'll loose my
e-mail account here, and may not be able to get another one soon. If someone
wants to replace me now, just send me a note, I don't ask for extra work
:-). Otherwise I'll continue til I can, so you don't have to worry about
these messages (subscribe, unsubscribe), they are taken care off.

Besides if someone send a "subscribe" message to the list by error, he is
obviously not a subscriber and will not see any help information sent back
to the list!

This is not to flame anyone but i keep seeing a beacon and WX station on
my map and it doesn't have a valid Amateur radio callsign other then
stating as follows:

NWSPTC>APRS,DIGI,DIGI,WIDE

If this is legal i for one never realized that the NWS could transmit a
WX station info on 145.790 without a valid call going along with the
beacon.

Like i said this is not to flame anyone but rather to find out the
legalalities of what a weather station can or cannot do!.

>when I command them, rather than having to leave them on the B+.

0) That's why I got the Garmin-20, for auto startup

1) Have you tried locking down the orange button?
   You will need to remove the batteries and start up at
   least every other day, or wait while it does a search the sky.
   I think the Garmin-45 has a big 1 F Cap and not a small
    backup battery inside. ( Lets hope the I/O setting comes
    up 4800 baud after a "cold start"

2) 7 Watts RF from my HTX-202 with a rubber duck 6in away starts my
   Garmin-45.

497. winAPRS, what I cannot do..

From: Kent V Hufford <khufford@erols.com>
Date: Tue, 16 Jul 1996 22:11:00 -0400
To: aprssig@tapr.org
Message-ID: <199607162211.SAA00520@smtp2.erols.com>
Rendered body type: text/plain

Just downloaded the lastest winAPRS 1.1.2.

The following I have not been able to do. Either I cannot get it to work, it
doesnt work, or it doesnt work yet.... or will never be implemented.

1. HSP (coming....)
2. Cannot define the default map, other than renaming Virgina AAGINA.
3. Cannot define the default size of the map window. It opens about half size.
4. Cannot make the map pulldown pop back up when I move the mouse of the
pulldown like the other pulldowns, unless I hit the left mouse button
somewhere else.
5. Cannot PRINT. PRINT not implented yet?
6. Cannot save a MAP window yet. Maybe related to 2. above..
7. NO windows based help file in program. Cannot access a help file of any
kind from within.
8. Does not support the RADIO AMATEUR CALL BOOK
9. Supposed to support QRZ callbook, I have not been able to get it to work.
10. Double click on station ICON sometimes brings up the station data
window... sometimes it doesnt. When it does, the map window goes back to
half size.
11. I have a DFjr coming this week. I have no idea if it will support it
right yet...

Some of the above maybe my fault. I have not found answers in the doc's.

I'm running it on a P166, 32megs ram, SVGA at 800x600 under WIN95a.

thanks,
Kent

498. Re: [APRSSIG:3049] Ultimeter II and KPC-3

From: Miami Network <0004818186@mcimail.com>
Date: Tue, 16 Jul 96 17:47 EST
To: aprssig <aprssig@tapr.org>
Message-ID: <63960716224736/0004818186NA3EM@MCIMAIL.COM>
Rendered body type: text/plain

Connecting the Ultimeter 2000 (if that is the same as the II)
is straight forward:

Pin #3 from the Ultimeter is Data Out
Pin #5 from the Ultimeter is Ground

Pin #3 from the Ultimeter goes to Pin #2 of the KPC-3
Pin #5 from the Ultimeter goes to Pin #7 of the KPC-3

Set the TNC as follows:

```
GPSHEAD 1 !!      /* This is the string that the Utimeter sends out /*
LTP 1 APRS WIDE   /* This is your path for the transmitted information /*
BLT 1 every 00:05:00 /* Sets timer 1 for every 5 minutes /*
LT 1  /* will have the Information from the Ultimeter /*
INT GPS  /* Put the TNC into GPS Mode Turn it off and then ON /*
```

It will work unattended and without a PC connected to it or
without the APRS software. We have several in Miami that are
set up this way for automatic Wx reporting to the National
Hurricane Center.

```
Hi,
   I just joined the list a few days ago and am very interested in finding out more about APRS.
    Is there a FAQ site that has info on how to set-up an APRS station and gives some general info on
it?  I am interested in what is needed for  a TNC and interfaces to it and what is needed at the mapping
 station and the mobile station.
   I am also looking for info on what makes one GPS a better choice than another GPS.

  I looked thru some of the search engines, and there are a LOT of sites out there.  I just have not
found onethat can answer some basic questions yet.
   Thanks for any info you may have.

As long as a VALID callsign appears SOMEWHERE in the Beacon and adequately shows
the station/operator ID that meets the letter of the ID law.  I verified this
with FCC in Kansas City about a year ago...  Again, the callsign of the
operator/station licensee MUST appear somewhere in the beacon text.

503. New APRSwx program

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 16 Jul 1996 20:35:02 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960716202231.29212A-100000@arctic>
Rendered body type: text/plain

Just for fun and while on vacation, I just finished a routine that tries to display the overall wind flow over the surface of a map based on the data from all WX stations on the map. Hit the WX-WINDS command and you will see about 450 little wind vectors all over the map showing the flow. This works at any map scale.

But it wouldnt fit in standard APRS, so I spun-off a new program that leaves out the DX and DF stuff and called it APRSwx. Since it will include future WX specific functions, it assumes you are registered for WX in order to display these additional features..

Again, I dont know that this has any real WX value, but it was just an interesting challenge. I expect that there will be additional changes to APRSwx very soon, so dont feel in any rush to get it... hi hi

It is on the tapr site as aprswx.zip.

> Anyway I cannot seem to find a way to set my alias to wide
> instead of relay. The old command of alt-s wide , is not in this
> version...

APRSdos REPLY COMMENT: It was just abused too much. The way to do it now is to use a TNC with multiple callsigns that can digipeate. The PacComm Pico TNC has 4 aliases and the KPC-3 can use the MYnode and MYhost calls. -OR- hook up a seoncd TNC to the same radio in parallel with the alias of WIDE.

DOnt think of this as being heavy handed. It just enforces the requirement that all WIDE digipeaters must also have the dual alias of RELAY. The overall APRS system depends on this standard.

I'll try it again at WD0GNK (club station at work). Silly thing seems to be deaf on 145.79 lately, though. I'll see if I can get it working better by then. In any case, should be better than when we tried in December. The ice storm we had that night did us no good!

Would a HID beacon not meet the ID requirements also ?

I know that the callsign somewhere in the BTEXT would fill the bill, but I was also under the notion that the HID if turned on will ID every 10 minutes if the station (TNC) has transmitted in the last 10 min period. I may be wrong but I too would like to know.

Personally I do not feel that it is too much trouble to ask for a measly callsign in the BTEXT but there are always alternate ways.

  I had done that as well. What I noticed was a solid black line that traced
the replayed track. The mobile doesnt move as it does in the DOS version. So
you'll have to look close. The black line doesnt stand out to well on my
monitor to define the replayed track.

But no callsign is given, the complete beacon is

NWSPTC 161914@162019z**Testing** NWS PeachTree City,GA
NWSPTC 161754@071620z3326.04N/08426.04W*Testing*
NWSPTC>APRS,AB4KN-2,N4NEQ-2,WIDE

Now if i read the rules correctly wouldn't any digi owner also place himself in
a legal position for trouble knowing that your digi is being used this way?.
Again let me make this clear i'm not flaming anyone, but would sure like to
know. I never seen anything in the BTEXT either except the above. It does show
a NWS symbol also. I don't want to open a can of worms but want to keep my
digi legal Hi.

These are NOT legal ID packets.  There is no valid callsign present.  Whoever is
doing the Peach Tree City operation needs to be advised to get a callsign into
their beacon somewhere...

>
>Now if i read the rules correctly wouldn't any digi owner also place himself in
>a legal position for trouble knowing that your digi is being used this way?.

NO, absolutely not.  The digi or voice repeater operator can not be held
responsible for an unlicensed operator/station using his/her facilities.  Most
repeater sysops would probably turn a repeater off, though...  This is the same
legal situation as an obscene/illegal packet bulletin/email.  The ORIGINATING
station is the responsible party (as well as the Originating BBS but this
doesn't apply in the case of repeaters) and would be the person cited by FCC.

>Again let me make this clear i'm not flaming anyone, but would sure like to

Relax, Bill.  You're safe.  If it's that much of a concern, though, you could
always SUPLIST the particular call and your digi will ignore it, but I'm sure
that in this particular case you're wanting to ENCOURAGE their operation and
help out, so perhaps a FRIENDLY phone call to the responsible licensee is in
order, Bill.  Sometimes people forget the small details when working on a big
project...

See my follow-up message yesterday explaining how we did it last year.

>What kind of equipment etc. would be needed?

A big beam and high power helps, but is not a requirement to participate.
Although no one heard my packets using a beam and 160 watts, I did
successfully copy meteor scattered packets from as far away as N0AN, 1078
miles from here. It was a lot of fun and everyone can participate. Just
dial 1-4-5-7-9 and listen!

This is not directed towards all nor just one. I have read messages on
here that use words like "illegal", "interfence", "he's a problem". Rather
than talk about someone that you've never contacted, contact them and let
them know in a nice way that there is a problem. You can get a lot more
done with a smile and a handshake than you can with gritted teeth and
anger!

There are many new hams joining us everyday. And everyday new hams (as
well as old) are making mistakes. I've been a ham for just a few years and

constantly have to keep a clear head about what I'm doing on the air. The moral here is, volunteer your help to help your fellow ham. This is all a priviledge and not a right! If we can't police our own, then we'll get policed! And with less than desirable results, this I am sure of.

I live just outside a small comunity in the Ozarks that has a failing "60's style" cable system. Talk about the interference problems! Try this the next time your in town. Put your 2m radio on 144.000 or 145.25 and see if your hear and static. Bet my bottom dollar ya do! What I do is identify the area, and if the "cow traffic" aint too bad, pinpoint the problem. Then I let the folks down at the cable office know about it. Everytime, they have thanked me and kindly asked me to let them know if I find any more problem areas. Simple!

This message wasn't planned to be this long but .... All I am saying is that your actions are reflected on all hams. So please, take a little time, voluteer your help and lets keep this hobby a pleasure to everyone.

"And that's all I got to say about that."

This station, whoever it is, continues to beacon thru my digi(WA4GKM-5), which is seen in several states. It is not legal and someone in the Atlanta area should call this person and tell them to stop! I was flamed by one of the Atlanta stations simply because I went over Atlanta aeronautical mobile and had relay in the unproto path. But he does not bother to simply call this person up and say "did you know this is illegal to beacon without a callsign".

>
>1. HSP  (coming....)
```

I have stated several times, I am working VERY HARD on this, it has many difficulties involved in getting BOTH Win95 AND Win 3.1 to work in a similar fashion.

>2. Cannot define the default map, other than renaming Virgina   AAGINA.

This is the CORRECT way to set your default map

>3. Cannot define the default size of the map window. It opens about half size.

All maps open at FULL size as defined by the map. If it opens at "half size" then the map is defined wrong. Send me the map and I will look at it.

>4. Cannot make the map pulldown pop back up when I move the mouse of the
>pulldown like the other pulldowns, unless I hit the left mouse button
>somewhere else.

This is a WINODWS function, I have NO CONTROL over this whatsoever at all. If you dont like how it operates, write to Bill Gates.

>5. Cannot PRINT. PRINT not implented yet?

The documentation clearly states that this is not implemented, it is currently low on the priority list but will be implemented.

>6. Cannot save a MAP window yet. Maybe related to 2. above..

Has nothing to do with #2, but is not finished. THis is about done but not very high on the list.

>7. NO windows based help file in program. Cannot access a help file of any
>kind from within.

CORRECT, and at present there are no plans on making one. This of course could change if enough people wanted one.

>8. Does not support the RADIO AMATEUR CALL BOOK

Have not heard of this one, get us info and we will try to implement it.

>9. Supposed to support QRZ callbook, I have not been able to get it to work.

There is an index file that is needed to go along with it. I will try to get it up on the ftp site.

>10. Double click on station ICON sometimes brings up the station data
>window... sometimes it doesnt. When it does, the map window goes back to
>half size.

Double click (left mouse button) should work. Version 1.1.0 sometimes didnt double click properly, 1.1.2 has that fixed.

The window going back to half size is THE WAY WINDOWS WORKS, I have no control over that. When a window is MAXIMIZED and a new window is created, the current window goes back to its non-maximized state.

>11. I have a DFjr coming this week. I have no idea if it will support it
>right yet...
>

Yes it does support the DFjr, and this is in the docs.

>
>Some of the above maybe my fault. I have not found answers in the doc's.
>

I have been updating the documentation over the last week, several of these are covered in the docs. I hope these answers help.

Sounds like overkill to me! I go mobile with a Grid 386, 4 megs ram, SVGA
mono under DOS with DOS APRS, and NO PROBLEMS!!! Not to mention the Garmin
55 GPS and Agrelo DFjr, all on 1 serial port!

I do, however, also overkill with a Pentium system at the QTH running DOS
APRS, of course.

Hasan, unless you just really want to keep the SMB connector on the Trimble
antenna, I'd suggest just cutting it off and replacing it with a regular
male BNC connector. It's easy to do, works great, connects directly to the
Garmin GPS 45, and costs a WHOLE lot less than the SMB adaptor. Call it
three or four bucks for the BNC, and two or three bucks for some small shrink
tubing to help distribute the stress from the cable to the BNC, and 15
minutes work. As I reported earlier on my experience with the Trimble
antenna, Jim Lawyer, AA5QX, can provide all the details about changing the
connector.

Well, Scott,

The point about using a P166. That is my HOME machine. Just dont want an
"answer" that I need

1. more ram
2. more video
3. or more of anything else...

My current laptop (which runs dosAPRS on one serial port, gps, etc GREAT) is
a TI 4000M.

However I cannot run winAPRS with GPS and TNC with the HSP yet... Of course
I could make a MANUAL HSP with a switch. Switch? I could program an ALTAR
with switches.. but this is not the 70s<g>..

Just this hour, my DFjr came in a box. 2nd DAY AIR (which took 8 weeks)

Kent

>
>Dennis - N4NR
>

I believe that Dennis is correct...When operating through nodes , we
sometimes used a ACRONYM to describe it...As long as the station ID's it's
callsign every 10 min he can be whatever alias he wants...The guy who said
its absolutely incorrect is partially incorrect ....It IS illegal to use an
NON CALLSIGN ALIAS unless you beacon your ID every 10.

Lets look carefully at the packets that were provided to the sig ok !!

NWSPTC 161914@162019z**Testing** NWS PeachTree City,GA
NWSPTC 161754@071620z3326.04N/08426.04W*Testing*
NWSPTC>APRS,AB4KN-2,N4NEQ-2,WIDE
-
NONE of these has the standard ID text so therefore there is NO ID text to
identify...If these are the only packets being xmitted then there is a
problem... BUT if every ten minutes we see

N0CALL /R NWSPTC /D RELAY /N

then this id's the station N0CALL as the ID (the /r)
NWSPTC /D idicates that NWSPTC is the alias
RELAY is the NODE

an alphanumeric with a /g would idicate the gate echo /G
Here is my ID on HF and packet (though I use callsigns) From memory,
the order may be wrong.

<<UI>>KD4EMI-3 /R RELAY /D ECHO /G KD4EMI-1 /B

/r again is the station callsign
/d is the alias
/g is the gate
/b is the PBBS

This is the standard convention...If the user is not ID'ing in this fashon
then there is a problem

This goes out every 9.5 minutes..

What should have been included was the guys ID text (if he sends it)
ANY TACTICAL or ALIAS can be used,(EVEN IN VOICE) as long as you IDENTIFY
yourself every ten minutes...HID transmits a ID packet every 9.5 minutes

Now, if you xmit PCTWX or whatever (the tactical callsign) as the id and
not the real one...then that isnt correct...

PS the same included for VOICE...you can speak tactical as long as you identify...
Dont you guys use nodes ??

>illegal to beacon without a callsign".

This whole issue is so juvenile! The two subjects have nothing in common., and the RELAY was at the end of the path- not just "in" it.

I know I politely asked Nick to stop using RELAY at the end of his *AERO MOBILE'S* path because it was causing thousands of retransmissions over 4 states, including ruining my wife's TV reception every minute (since the packet antenna is on the tv mast). My wife tolerates APRS, but doesn't like it well enough to have a digi at home.

And by the way, I waited until he did it twice before i mentioned it to him. A week of two before that, it was being done from the mobile.

I know it makes a station REALLY visible, but folks need to understand that EVERY APRS station relays you each time you beacon this way... including my battery powered station whose power supply is sized only for its intended use and NOT for digipeater service.

This is not flaming- it is preserving and conserving radio bandwidth.

If this becomes something that folks do a lot, then maybe we should rethink having a RELAY alias at all. It would be a shame, since it does help out when used properly. As far as home stations go, I don't think we can just use O C T and change our alias because I think APRS periodically resets the alias to RELAY, doesn't it? Yes, I know I can turn DIGIpeat off in the InitTapr file of APRS- but then I couldn't digi thru my house while in the driveway and under my control.

As far as the guy in Peachtree City goes, why don't some of you people who have such a problem with it just call him and cuss him out if it bothers you so much. Isn't it his problem, not yours? I think he is Eddie, N4YTR.

I know that The King Of The Flamers is just waiting in the wings!

APRS is supposed to be FUN!

Maybe he has a KPC-3 and has it set so that it ID's in CW every

9.5mins.. This is how I have my APRS TNC set..

Did I miss the FCC repealing the section of Part 97 that allows for the
ID of a station with CW??  I don't know but think it just might be
possible these people could are using a Kantronics TNC that allows for
CW iding..

Let's don't suggest that someone is doing something illegal untill we
have checked out all possibilities..

BTW I use the CW ID feature of the KPC to ID my APRS setup every 9.5
mins, and according to what I have read, This is the only ID I need to
be concerned with..

Yes, even the lastest version of WinAPRS fails with a
"Unexpected DOS error 23" when it loads
under OS/2.  This is a MAJOR bug. OS/2 has
a fully operational Windows 3.11 system.
In fact, on my system it *is* an actual
licensed copy of Windows 3.11!
Any Windows 3.x program which will not run
on it is seriously flawed.   Pleeeese... this
needs to be fixed.

Or, better yet, give up on that sorry excuse for an
operating system (Windows) and do an OS/2 port instead :-)

Rendered body type: text/plain

My previous posting about the DOS 23 error from
OS/2 when WinAPRS loaded was on a machine
which did not have *any* Win32s support.

I installed WinAPRS on another OS/2 machine
with IBMs Win32s 1.25 installed. The results were
much worse. The program did actually start this time.
However, I was greeted with a dire warning which
said that this version Win 32s didn't support 0x1b access and
asked if I wanted to abort or return and error code
to the program. I choose return error code to pgm.

Big mistake. WinAprs did actually put up a USA map.
However, when I attempted to open the TNC it crashed
the whole system with a Trap 3 :-(

I remember some discussions of helicopter mounted GPS receivers awhile back.
Did anyone ever get any experience with it?

I'm wondering about attaching Garmin GPS 35s (the one that looks like a
computer mouse) to the skid, and the effects of the whirling blades above.

Please let me know quickly if you have first hand explerience with whether
this worked or not.

Amateur Radio regulations require that a station identify itself every 10 minutes when
transmitting Bill, but they don't, to my knowledge, specify that a packet station's call
be exclusively an amateur callsign....so long as that station is sending an ID packet,
or for that matter, a CW ID, every 10 mins, it should be legal. Its basically no
different than naming a wide area digi.......

Great idea Bob....but one question before I download it....is this surface wind or upper
level wind and what is the source of the data please....I am sure you know the NWS/FAA
switched over from SA format to METAR format on their hourly weather surface
observations July 1, thus making the current show NWS functions of APRS non useable...

MacAPRS has had this winds-aloft type dislplay since before Dayton. And this
just got finished in the WinAPRS version recently. However, the intent
and source data are some-what different..   The reason for this in the Mac/
Win versions is for using the Winds-Aloft-Data for doing balloon predicitons.
The source data is from the FAA / Ohio State Univ.

Check out the doucmentation at:

http://aprs.rutgers.edu/APRS/

and

http://www-ns.rutgers.edu/~ksproul/APRS/APRSWIND.html

Re: Running WinAPRS under Win-OS/2

>Any Windows 3.x program which will not run
>on it is seriously flawed.   Pleeeese... this
>needs to be fixed.

Dale, let's be a little bit careful here. No one I know is a more devoted user of OS/2 than me. I run it on four different machines and have been using it since 2.0 and am now running Connect. However, there are MANY 32 bit windows apps that DO NOT run under OS/2's Win-OS/2 because they REQUIRE version 1.3x of the 32 bit Windows subsystem. Since there isn't any OS/2 1.3x (latest being around 1.25), any program designed to take advantage of the latest capabilities of Win32s will not work under Win-OS/2.

This is NOT a WinAPRS bug. It is part of the on-going war between uSoft and IBM.

Look into the OS/2 Echo of FidoNet and you will see tens if not scores of Windows programs that WILL NOT run under OS/2 with Win32s versions prior to 1.3x. (In other words, they require the LATEST version of Win32s, and will not run at all without it.)

Asking the authors to write "down" to OS/2's Windows level support, is in my mind, going way too far.

I disagree completely with your conclusion that "Any 3.x program which will not run on it is seriously flawed." The problem is NOT the 3.x program, it is in compatibility of the Win32s 32 bit subsystem with Win-OS/2. It is more games from Mr. Bill, who, from my experience has taken every opportunity to break the interoperability between Windows and OS/2.

Let's not blame the software authors, when it is VERY CLEAR that the problem rests in Redmond. There isn't a damn thing the authors can do about this problem except not use calls required by Win32s 1.3x...which is telling them not to advance the features of their programs because of an incompatibility with an operating system they don't even care about. Expecting a bit much, don't you think?

I fully agree that we ought to get a version of APRS out that is a port to a "real" operating system like OS/2 instead of a kludged up DOS operating shell like Win95. I run a dedicated Win95 machine for WinAPRS and believe me, Win95 is a sorry comparison to OS/2...but it is the only cost-effective way to run WinAPRS well (Win-NT being pretty pricey).

We can hope that the Bros. Sproul would do a port to OS/2, but I just don't know if there is enough demand to make it worth their while.

I MUST object to this message.

WinAPRS is NOT, repeat NOT a Windows 3.1 application.  It is a Win32
Application.  This means it is a full 32 bit application and intended to
run under Win95 OR WindowsNT.  It will run under Windows 3.1  ***IF*** you
install Win32S.  Win32S is a collection of DLLs from Microsoft that allow
32 bit applications to run under Windows 3.1 or 3.11.

I have done NOTHING special to make WinAPRS run under Win32S, it just
works. The current version of Win32S is 1.3, It is my understanding that
the current OS/2 version of Win32S is 1.2.5.  I have NO IDEA of the
difference and have seen NO documentation to 1.2.5 whatsoever at all.

On the OS/2 side:

        I have asked SEVERAL times, if ANYONE knows anything about OS/2
programming AND Windows programming could talk to me about the differences
but NOONE has been able to answer my questions, those that program OS/2
dont know anything about Windows (3.1 OR 95) and those that know about
Windows, dont know ANYTHING about OS/2.  I need an explaination about the
differences and what is envolved in porting to OS/2.  But so far, I have
had ZERO feed back on this question.

So Mr. Heatherington, my program is NOT "seriously flawed" but your
assumtions as to why it should work are.

Mark Sproul

I would like to add my count to this discussion.  I also installed a
RG-174 crimp connector to my Trimble.  It was easy for me.  BTW I managed
to break one of the little fingers off of the SMB connector that came
with my GPS-20.  I think the connector is somewhat fragile.  A BNC is
very very tough.

Good idea except it obsoletes alot of TNC's.  Do you have any feeling when
the "other manufacturers" will upgrade their EPROM's?  I don't want to
double my TNC's or buy new ones.

>
>This is NOT a WinAPRS bug. It is part of the on-going war between  uSoft
>and IBM.

I well aware of the Win32s 1.3 issue.  I will conceed that the bug is in Win32s
1.3 and probably not winaprs.  I call it a bug because it breaks the ability
of windows programs to run under licensed copies of Windows 3.1 in the
OS/2 environment.  My copy of windows 3.11 is paid for. Bill Gates got
his money!  Bill has an obligation to support his users.  It would be
```

poor business practice to intentionally write code which causes customers software to fail. Therefore it must be a bug. I want to know when Bill intends to fix it so we OS/2 users can once again use Win 3.1 programs which we paid for the ability to run.

So, until Microsoft fixes Win32s 1.3, software authors should work around the win32s bug and demand Microsoft do something about it. Those that don't avoid Win32s 1.3 will pay the cost in increased calls to their support lines from irate OS/2 customers and reduced product sales.

>Asking the authors to write "down" to OS/2's Windows level
>support, is in my mind, going way too far.

Just exactly what killer-must-have feature in WinAPRS needs Win32s 1.3 to operate? Would it have been impossible for WinAPRS to have been written 1 year ago (before Win 32s 1.3) ? I don't think so. I think it's more of an educational problem. Many programmers probably don't even know they're writing code which will not run under Win-OS/2 and thus limiting potential sales.

>
>I disagree completely with your conclusion that "Any 3.x program which
>will not run on it is seriously flawed." The problem is NOT the 3.x
>program, it is in compatibility of the Win32s 32 bit subsystem with
>Win-OS/2. It is more games from Mr. Bill, who, from my experience has
>taken every opportunity to break the interoperability between Windows and
>OS/2.

Again, I bought my Windows 3.11 from Mr. Bill. Why would he want to cause my applications to fail? Even the WIN-OS/2 in OS/2 "full pack" is licensed from Microsoft. When you put "requires Windows 3.1 or higher" on the box I expect it to run in Win-OS/2. If it doesn't then it's defective.

>
>Let's not blame the software authors, when it is VERY CLEAR that the
>problem rests in Redmond. There isn't a damn thing the authors can do
>about this problem except not use calls required by Win32s 1.3x...which is
>telling them not to advance the features of their programs because of an
>incompatibility with an operating system they don't even care about.
>Expecting a bit much, don't you think?

What features would the Bros. Sproul have to eliminate from WinAPRS, if any? Are these worth the reduced sales? Is it not simpler to write a Windows program for WIN-OS/2 compatibility that port it to native OS/2?

[deleted]

>We can hope that the Bros. Sproul would do a port to OS/2, but I just
>don't know if there is enough demand to make it worth their while.

If OS/2 users keep using pre-win32s 1.3 windows apps and don't complain about the lack of native OS/2 apps or non-runnable Windows 3.1 apps they will continue to be invisible to ISVs. ISVs, seeing no vivible OS/2 users will continue to falsely believe there's no market for quality OS/2 software. The latest figures I've seen indicate there's at least 13 million OS/2 users with monthly sales of OS/2 in the 500,000 to 1,000,000 range. This exceeds NT by a factor of 10 and is closing in on Macintosh. If there's "not enough demand" for OS/2 software then the NT market must really be dead.

Oh well. I guess this is enough off topic comments for one day ;-) Sorry for eating the BW but I just had to vent.

The solder type works great too.  Get RG-174 BNC and drill out the hole
just slightly and you will not need any special crimping tools.

You are absolutely 100% correct. It is NOT a WinAPRS problem. It is an
interoperability problem between Win32s versions and OS/2, period. If your
program had been written to the 1.25 win32s extensions and  not the later
1.3 extensions, then it would have worked, but that makes no sense at
all...using the old version of the win32s subsystem.

Dale...IMHO you are WAY out of line here. This isn't the Sproul Brothers
job, but a hobby. What makes you think you are entitled to set the
priorities for someone else's hobby time? There are many other features
that Keith and Mark want to work on. Maybe they'll do an OS/2 port, maybe
they won't. They certainly know you want one...but somehow at this point
I bet they are less likely to do than before you started ranting.

Personally, I wish they had never started on WinAPRS...MacAPRS would be
much further along now. I keep them aware of what I want them to work on,
bug them on the things I need, but I understand that their priorities are
different. Why is it so hard for you to understand that they don't live
to make you happy?

Given that they had never programmed Windows before, I think it is
absolutely amazing that they met their short, self imposed deadlines on
WinAPRS. They deserve nothing but praise from this sig. Where do you get
off calling their program "seriously flawed"? Get real, or get off the
sig.

> I MUST object to this message.

While Dale's note is a little heated, I have to agree. OS/2 *IS* still out
here and someof us *DO* use it. I seriously doubt I'll beta test Win9x for
Micro$oft anytime in the near future, and cannot justify NT at home, so I
guess I'll have to use the DOS version for the time being.

> WinAPRS is NOT, repeat NOT a Windows 3.1 application. It is a Win32

Dale's later note identifies this.

> I have done NOTHING special to make WinAPRS run under Win32S, it just
> works. The current version of Win32S is 1.3, It is my understanding that
> the current OS/2 version of Win32S is 1.2.5. I have NO IDEA of the
> difference and have seen NO documentation to 1.2.5 whatsoever at all.

>From what I can appreciate, the princlple difference between v1.3 and v1.25 is
to increase the size (and number) of required DLLs and to not completely
document all of the changes to 1.30. The appearance is to make software
incorporating v1.3 software incompatible with previous, working Win32s
releases.

> On the OS/2 side:

> Windows, dont know ANYTHING about OS/2. I need an explaination about the
> differences and what is envolved in porting to OS/2. But so far, I have
> had ZERO feed back on this question.

I beg to differ. While I cannot necessarily speak to Win9x, I have offered,

within limits of nondisclosure to assist by providing a platform for
compiling, and debugging, the code. As well as testing it. The native code
should compile cleanly. The device calls should be obvious and move cleanly
to OS/2 DLLs. Further, a 32bit windows port is a possibility depending on the
OS/2 compiler chosen.

> So Mr. Heatherington, my program is NOT "seriously flawed" but your
> assumtions as to why it should work are.

Or, possibly, expectations. I'd have assumed, based on earlier announcements,
that a port to Windows would not have been hampered by Win32. I was somewhat
dismayed to discover that it was. While the functionality of WinAPRS
generally exceeds that of the DOS incarnation, I really was expecting
something closer to the DOS product as a first start.

All that said: I've been very happy on the 2 occasions I've brought up
WinAPRS here at work on the NT machines. I just can't plan on every machine I
develop for having that, and I *WILL NOT* plan on it being Win9x.

I disagree: I've found no documentation that indicates that Win32s v1.30 has
improved operability or enhancement over v1.25 save that it's different. I
could have missed something.

Why, pray tell, does it make no sense at all to use the older
version of win32s to pick up, for free, 13 million additional
potential customers?

You might want to download the APRSSIG Mail archives at tapr.org
and use a search program to find key words. There has been a lot of
ground covered over the last 1.5 years.

There is a WWW doc link and a how to get stated web page
BUT you are still going to need to read the DOC file for
the Version of APRS you plan to use.  DOS , WIN , MAC

How to use TNC's , Trackers  and GPS units, WX stations  and DF
are covered in the DOS APRS docs that come with the program
and much more in the mail archives.

For those that attended Dayton, we had on display X-APRS showing map
displays working.  Which is basicly proof of concept.  At this point, ALL
that we have working is the map display.  We are hoping to have full X-APRS
by sometime next year (1997) We might, I repeat MIGHT, have beta by X-Mas
and delivery by Dayton, this is what we would like but ARE NOT PROMISING.
The translation to Windows went very well and from our initial
investigation and testing, the translation to X should go very well.

I would just like to take the time to thank Bob Bruninga and the Sproul brothers for taking the time to offer the amateur radio community such a fine package as APRS, WinAPRS and (MacAPRS ?? who did that port?).

I use APRS and more lately WinAPRS and wish I could to such a fine job as these gentlemen. My only only "complaint"...which it was all free.....:-). Only kidding, I am glad to pay for the programs. I am now waiting for the new WinAPRS that I hope comes with my registration.

Again my thanks and hats off to those that have provided such a fine product.

This is a bit heavy handed. You certainly have the right to change the program any way you like, of course, but you are dictating procedure that YOU feel is the only way the system should be run. Perhaps you ought to leave a bit of latitude for those of us who don't agree.

I will not go out and purchase TNCs for any of the sites I have control of, and neither do I think any one else should. A high site digipeater need only have a single alias. To demand that we 'upgrade' because of your thinking we have gone 'out of control' is very heavy handed.

Please reconsider your decision.

John W. Wilson, KN4HX

No, Kevin. That would mean that any ID is acceptable which is NOT the case. A VALID identification contains the FCC-ISSUED CALLSIGN every 10 minutes. Tactical calls are legal when used in conjunction with a PROPER ID.

0004818186@mcimail.com (Miami Network) and KD4EMI writes:
-
Seymour is referring to the fact that a mobile should never have relay in his unproto...NOR SHOULD A WIDE ALSO BE A RELAY...

Ive tried to explain it to him why this is wrong ...can someone who is more prose oriented please assist... I told him that I have one string with

 RELAY, WIDE and another
WIDE,WIDE

when I am mobile..he replies....

This is just silly. Look at what has happened. We now have
TWO strings that mean the same thing! The trick would be
to just have WIDE for the alias.
>
Apparantly RELAY means the same thing so if a mobile is transmitting
RELAY,WIDE   then a DIGI set to WIDE-RELAY will repeat the signal
and a mobile with WIDE in the path will also get repeated?
>
>I missed something here.

KD4EMI WRITES >
Yup.. would be nice to have just one string...WIDE,WIDE
But in fringe areas you wont get into the system... So if you have
RELAY , wide you can count on the local APRS house to digi you into the
system. BUT SINCE the WIDES are not relays you need two strings...
Plus out of town people can use either unproto with sucess..

SEYMOUR SEZ

>Perhaps we need ALIAS like COUNTY, CITY, LOCAL, UNIT, BLOCK, AREA
>etc. etc.

EMI sez
NO NO NO !!!! READ THE DOCS !! MAKE ALL THE WIDES THAT YOU PUT UP
WIDE/RELAY in the alias not the unproto...

SEYMOUR SEZ
>The answer is to N E V E R put RELAY in as part of your PATH
>when you are mobile.
>
EMI--
NO NO NO
Seymour, your putting up so many wides around here...get it right !!
Ive thrown my hands up in frustration....PLEASE SOMEONE HELP !

I dont know how else to explain this..
Mike

>I saw some mention of it a long time ago, but can't locate it. THANKS!

After searching for about 2 weeks, I found one from NEMAL ELECTRONICS in
Miami, Fl.  It was about $25.00, but there isn't a minimum order (like
Pasternack's whopping $100).  Their number is 1-800-522-2253.  Ask for part
No. NE-9410, SMB Jack --> BNC Plug.  They were really nice and got it to me
here in GA in 2 days.

Hope that helps.

Sorry, I don't agree John.  This is Bob's program. He knows it better
than any of us, and he certainly has every right to make such changes.
There is no reason for you (or anyone else) to purchase new TNC's. You
```

can run *old* versions of APRS. But I would suggest that you comply with
Bob's wishes. (if not now, then eventually)

Yes! I believe Don, a friend of Kieth Sproul, wrote the article. Of course
that article was written in April, so the information was slightly
outdated. That just the way it is.

For general information to some one who is not a "seasoned" user of APRS,
I think the article was just about right. Wad ya Tink?

In an effort to educate the uneducated and to demonstrate the many uses of
APRS and our hobby, I took a group out last night to "hunt down" cable TV
leaks. We used three "tools". A 2 meter radio, a portable TV, and
APRS/DFjr/GPS. I had previously found three leaks in the system, so it was
not very difficult showing the folks, one of which was the cable
maintenance manager. We started out using just the 2 meter and the TV.
After which, came the big suprise. The DFjr setup showed leaks all over
the place! There were a few jaws hitting the ground, including mine, when
we looked at the screen. I set the threshhold a bit higher on the DFjr and
away we went to identify and locate. 2 1/2 hours later, we had found 11
new leaks in the system!

There were at least two very suprised people last night. The maintenance
guy and myself. Not to mention the three others in the van. All in all, I
think it was time well spent. In that I was able to demonstrate our hobby
and get a few more people interested. I learned 2 things last night, 1.
The cable company had no idea that this many leaks were out there, and 2.
This stuff really does work!

>win32s to pick up, for free, 13 million additional potential customers?
                                    ^^^^^^^^^
Because like most of the hype surrounding any operating system release,
the 13 million additional potential customers is pure hyperbole. Get real.
APRS is the discussion, not the entire software universe. Now, by the time
you go down the market tree:

1. OS/2 Users
2. Who are hams
3. Who are interested in digital
4. Who are interested in APRS digital
5. Who are actually going to run OS/2-APRS, given the existence of
```

```
   a dos and Win3.1x/Win32s and Win95 and Win-NT platform, not
   to mention MacAPRS

If there are 150 "real" potential customers for this product, I would be
very surprised. So, I stand by my original assertion that "it makes no
sense to write to an 'old' set of extensions for a VERY limited number of
potential customers."

In the end, it doesn't matter what any of us think. The "market" will
determine what really happens. If there really is a terrific demand for an
OS/2 version it will happen. Funny thing...there are very few OS/2
versions of any ham software, PHS (multi-mode data controller software
being one of them...and it hasn't been updated in years), and PMNOS
(tcp/ip for packet...also hasn't been updated forever and development is
dead)....what does that tell us?

Until such time as the market shakes out, the best bet for hams is an  OS
that runs its own stuff really well, runs dos apps very well, and manages
to somehow run Windows software as well as it can,
given what it is.

Sure sounds like OS/2 to me!

What we can hope for is that either uSoft or IBM get their act together to
provide the highest order of interoperability between systems....but I
wouldn't hold my breath where Mr. Bill is concerned...just ask the
Department of Justice regarding "predatory business practices"....they
have a rather extensive file on the Rascals from Redmond.

I have to stop contributing to this thread on the APRS sig...it seems
quite a bit off topic unless we think we are somehow convincing Bob to
write an OS/2 version <VBG>. 73,

>gerry

You aren't disagreeing that the problem isn't WinAPRS, you are saying the
improvements in Win32s 1.30 aren't worth much. Hell, Windows itself isn't
worth much...but it is all we have (for the Intel platform and
multi-tasking APRS). My bet is that using older versions of Win32s is just
setting the developer up for later problems with Mr. Bill and his penchant
for breaking things that don't adhere to the latest alleged standard. 73,

Yes, I put a GPS receiver in a helicopter and we put it inside under the
front window on top of the dash. Had no problems with the blades, it was
a six channel, and had all six birds in veiw except when the helicopter
was in a tight turn. hope this helps.

Scott Arnold

On Friday, 19-July-1996, Scott Ratchford, KC5JGV, presented a most interesting discussion of using APRS, GPS, DFjr, etc., to find cable "leaks".

MOST interesting, Scott. How about some more details of your setup and operating techniques? In particular, how does the DFjr work with the multiple cable leaks? Looks like it might get confused, since all these signals are identical, just coming from different places. Wouldn't that just look like a severe case of multipath? Also, what kind of receiver were you using for the DFjr, and what frequency did you listen to?

```

Anybody live in the Phoenix area that could give me hand getting APRS to work on a laptop. I have a Zenith Supersport 286 that I am trying to get working with a KPC-3 TNC. When I start APRS76F, it goes through the start-up questions, but when draws the map, it comes back with a error 68 and stops.

Any help will be appreciated.

>Dennis, I have used a Magellan GPS 3000 with its associated data/power module as a stand alone tracker and have been very pleased with the results. Sat acquisition after
initializing is usually two minutes or less and the GPS 3000 tracks well with the internal patch antenna if you set it up on the dash of your vehicle under the windshield. I have configured my stand alone tracker with an AEA PK12 TNC which works very well although I am sure that a KPC-3 would work as well. The NMEA-0183 data output connects directly to the PK12 with no level translations necessary. The Magellan external active antenna (30 db gain) works well although it is expensive at
$99.95 (US funds). The data/power module uses a SMB termination for the external ant.

I have written a technical document on my stand alone tracker and if you are interested I would be pleased to send you an email with a copy and diagram. The Magellan GPS 3000 has worked flawlessly and another user in our local APRS group is also pleased if you would like another opinion. Any questions, please fell free to contact me by direct email.

I will visiting parents in OH on the east side of Columbus. Will be looking for APRS activity while traveling their and while staying. Is 145.79 the frequency to use?

Also will be going to southern IL just across the Mississippi in IL (Godfrey). Will be looking similar activity. Same frequency question.

Any of you APRSers out there in those areas that can answer my question.

Rendered body type: text/plain

-- [From: John R.B. Adams * EMC.Ver #2.5.02] --

My recent quest for info re the Garmin 45XL yielded the following, which I pass along in the chance that it might be of interest to someone (anyone) else!

'NEW' G45XL

....

Called Garmin on 800 number and talked to representative. The XL will not be out until the end of the month. It is physically same as the 45. It has new fonting to make it easier to read. It has a track back feature (TracBack) to allow retracing your steps when hiking (saves working back thru waypoints). Has a dedicated compass page that looks like a round compass. It has a resettable trip odometer. It has a feature called EZINIT that gives faster initialization on initial start or when you have moved 300 miles or more. It has an INTERNAL LITHIUM BATTERY for memory backup.

....

My sincere tnx go to Bob Radmore, N2PWP, for gleaning this info and sending it along to me!

73 de VE3ASX (John).

I'd strongly recommend the Garmin GPS45. Garmin has apparently introduced and update (GPS45XL) and you can get good deals on the base -45. I've a jaundiced view of Magellans hardware these days.

Yes Doc!
145.79 is growing daily. GPS, DIGI's Home stations, weather stations all popping up daily. Ohio seems to be quite fertile for APRS. Lots of stations on the air. I am in Mansfield, 30+ miles to the north of CMH but I can hear that way pretty good. Looking forward to seeing your packets!

Hmm, interesting...  All the new operating features mentioned about the new
G45XL are already on the GPS38 (except maybe the lithium battery; not
sure).  Is it safe to assume the G45XL will have the external antenna
connection and wider voltage range of the GPS45?
```

Just a request. There was an attachment claiming to be "winmail.dat" to your question on the GPS 45XL/GPS38 similarities.

Can you and Windoze 9x reach an agreement so that your messages are not MIME encoded most of the time, and that the attachments don't appear?

I enjoy hearing from you when you're on, but I consider uninvited MIME
messages a potential security leak.

601. javAPRS Update

From: Steve Dimse <sdimse@bridge.net>
Date: Sun, 21 Jul 96 00:37:59 -0400
To: <aprssig@tapr.org>
Message-ID: <199607210435.AAA22894@bridge.net>
Rendered body type: text/plain

Thanks to all of you who emailed me about javAPRS. It's nice to see the level of interest in this project.

I've been busy finishing my paper for the Digital Communications Conference, so I haven't done much in the way of new features. You can read the paper at:

<http://www.bridge.net/~sdimse/dcc.html>

The current version fixes a few bugs, and cleans up the display code a bit for faster drawing. I also added a new method of calibrating GIF maps to make it easier to use DeLorme Street Atlas to make the maps. Check out an example of DeLorme maps at:

<http://www.bridge.net/~sdimse/gm2.html>

Stay tuned for further developments...

Steve KO4HD

I vaguely recall someone saying there was some disadvantage to the Garmin 38 vs the 40. It seems like the 38 lacked the external antenna connector or data connector or something? Does anyone know what if any features the 40 has that are lacking on the 38?

Anyone know of any place in the San Francisco Bay area that has a good deal on the 45?

Also, since I now have a full day to myself, does anyone have any suggestions as to the places of interest to hams? (Fry's is already on the list.)

One night things were getting slow on APRS so two of us in Central Florida begain to explore some of the side features of APRS. We found C W mode to be quite a change and somewhat useful for increasing ones copying speed. I now use it while working on projects. It is nice to be able to monitor any new developments without having to watch the screen all the time.

Then my partner, using MacAPRS, discovered voice mode. He ran that for a couple of days. Then one evening we were experimenting with line lengths and why characters were being lost between dosAPRS, WinAPRS, and MacAPRS. I sent him a string 012345678901234567... etc. 67 characters total from dosAPRS and he received only 47 characters in WinAPRS, and 51 in MacAPRS. Then he sent me a message how funny it sounded at his end with the Apple. It pronounced the number string: ONE SEPTILLION OCTILLIAN.. etc. He later found that it was his TNC set up that was limiting the number of received characters.

Then he found his computer would do singing mode with APRS. In default mode it was singing lines in DOUBLE BARITONE. He found 19 options of singing voices. It was a barrel of laughs.   If anything in the line rhymed, it would come out really funny.

Jim, I know your experience in this area is extensive and sound right on the mark for rules for hams. Please excuse this question for my naivette. Do I understand correctly that hams are second users of 2 meter and the government is primary? I thought I picked that up in another discussion, darned if I remember where... Then if the NWS entered a broadcast with there id, could that not be primary use?

Personally, if the information is relevant and works within the parameters of the information system APRS users have set up, I welcome it. Sure, sure, I'm not speaking as a legal point, and I'm tempting fate, here, but unlike, say, sport scores - weather has a broad base of benefit. Some time ago, several of our local group (NIAN) and folks in Iowa were talking to NWS about uplinking direct data but a stumbling block was converting the format direct from their data stream... I've lost track of this as time has been to scare to attend meeting and events :(

Dan Kasberger, N9XHP, Chicago!

btb - If you are planning to attend the ARRL convention in September, here in our nortern Illinois area, it would be wonderful to know if you are interested in APRS. There is a fine network in the region and we'd like to show it off and appreciate comments from all the experienced folks that might be visiting.

In a message dated 96-07-18 19:39:36 EDT, you write:

>No, Kevin. That would mean that any ID is acceptable which is NOT the case.
>A
>VALID identification contains the FCC-ISSUED CALLSIGN every 10 minutes.
>Tactical calls are legal when used in conjunction with a PROPER ID.

Garmin non-aviation units have a 99 KNOT speed limit.

FYI: If you operate a GPS unit on board a commercial airliner you can expect to be told to turn it off or possibly have it confiscated! Operation of a GPS receiver can cause SERIOUS interference to the navigational equipment on the

airliner!!! In light of the recent TWA disaster, it's a sure bet that anyone
found attempting to operate radios, laptops, GPS's and so forth will certainly
be questioned!

Both the Garmin 40 & 38 have a built-in antenna - no external connector.
The 40 has essentially the same operating features as the 45.
But the newer 38 has a few additional operating features which interestingly are what has been added to
the newly introduced 45XL.

Just fly Delta. It is perfectly OK, and allowed in their in-flight mag
rules list.

What is SERIOUS interference? I have operated airmobile with both Garmin
and Motorola, and the FAA just put portable blue boxes with Gel-Cell, GPS ,
TNC, and Motorola radio in all the local helicopters for the Olympics. The
GPS is a rockwell. I hope the SERIOUS interference doesn't cause problems
with those 110 aircraft.

Ralph

Here's the problem:

My PK-12 tracker, which I finally got on the air today, does not show up on my WinAPRS station. I've also not seeing any other stations on my home APRS, but up until now I've blamed that on a lack of APRS activity in the immediate Jacksonville area and no available digis within range of my hidden antenna (homeowners association, you know!),   I'm probably doing something really stupid, but I'm stumped! So I've turned to the kindly, and always sensitive, members of the SIG!

Home station puts out good power and I can hear my packets all around the east side of town. WinAPRS is set up as VHF relay, wide.

Ralph,

There is a rather large difference in placing known equipment in the cockpit, or under the control of the cockpit, as opposed to putting completely unknown and uncontrolled equipment in the airplane/'copter. I personally have had two experiences, one in an MD-83, the other in an B-767, in which a passenger's "passive" toy produced measurable, verifiable, interference to the navigation equipment. Both qualify as modern, more or less, airplanes.

The chance of trouble is small, but the magnitude of the difficulty can be very, very large if it does occur. Smoking hole in the ground type of problems.

However, if the airline allows the use of your "whatever," go ahead. Just remember that the Ops Specs for carriers is not entirely consistent, and what may be approved on one carrier may be a $10k fine on another.

I once made the mistake of getting involved in this issue on Compuserve, and though I had learned my lesson. Guess not.

Alan

What you have is the header on a different line from the data.

Try the command 'bbsmsgs' and set it to the opposit state (on/off).  This
is a very poorly documented command with the PK12.  It has to do with
'TAPR style messages'.  KC4NMY and myself discovered this while attempting
to get the Miami Hurricane Center up and running on VHF.

Don't forget to set your HEADerlin to OFF.  That is the obvious change,
of course.

The GPS 40 has an external antenna connector, but it's some small
connector, not the BNC that the GPS45 has. It's on the back of the unit
and could easily be mistaken for a mounting screw, etc....

It's called a "BMX" connnector or something similar.

Maybe I missed the relevent part of the discussion, but I thought passengers are not allowed to operate even some passive electronic equipment during flights. So how is it possible to chart the progress of a commercial flight that one is on? Furhermore, is it even physically possible to read enough satellites through the small airplane wndows to get a lock?

> interesting discussion of using APRS, GPS, DFjr, etc., to find cable
> "leaks".
>
> MOST interesting, Scott. How about some more details of your setup and
> operating techniques?

My setup is a Grid 486 Laptop, Garmin 55 AVD GPS, Radio Shack Pro-2026 Scanner, MFJ Data Radio, Kantronics KPC-3, Agrelo Engr. DFjr.

>In particular, how does the DFjr work with the multiple cable leaks? Looks like it might get >confused, since all these signals are identical, just coming from different places. Wouldn't that >just look like a severe case of multipath?

Using the DFjr to find multiple leaks on the same frequency, is not that difficult. The trick is listening to the signal. Initially, yes, there is multi-path. But you just watch and listen and the signal direction becomes quuite clear! You can also increase the threshhold on the DFjr, which help in avoiding false signals.

>Also, what kind of receiver were you using for the DFjr, and what frequency did you listen to?

I was using the Radio Shack Pro-2026 Scanner on 145.250 and 144.000 with the DFjr. And the HTX-202 HT for "close proximity" work.

```
>

>               K5DTN
>               chead@exame2.dseg.ti.com
```

I hope this helps. If anything maybe some of our fellow APRSers will get oout and try the same thing. I am always looking for new and unusall uses for our hobby and this is just one of them that can be both benificial and educational.

Have Fun!

How does listening on these frequencies pick up cable leaks?

Dave

Rendered body type: text/plain

If anyone knows how to get this to the Cave Radio and Electronics group at http://www.Sat.dundee.ac.uk/~arb/creg, They might find it interesting....

Dear Mike Bedford, G4AEE:

I thoroughly enjoyed your QST article about Cave radio. As an avid teenage spelunker 30 years ago, I can identify with the sport. As the author of the very popular APRS packet tracking system, however, I wonder if you have explored the advantages of packet radio as a means to extend the range of VHF/UHF radio via multiple hops?

Although APRS is normally based on GPS position reporting, its map display is ideal for tracking underground teams in the cave! (A sketch of the cave passages can be easily prepared in just a few minutes using a mouse. Absolute lat/long accuracy is not required since GPS could never be used even an inch underground). As long as the sender places himself on the map approximately by cursor movement, all receving stations will see him at that location! Even positions in uncharted passages can be reported by estimating your location relative to the known sketch.

The advantage of using packet is based on one fact.... That you can EXTEND VHF/UHF radio ranges by simply dropping packet digipeaters along the cave route as you pregress inward. These digipeaters can relay VHF or UHF communicatinos over and over again (up to 8 times)! DIGIPEATERS can be built with a single HT and tiny packet TNC. Running on AA cells each digipeater could last for a few days and be packaged into less than a 1 liter volume. APRS uses an effecient connectionless protocol and GENERIC callsign ALIASES so that the cave units do NOT have to remember the callsigns of the digipeaters or how to construct the path!   Simply assign the generic callsign of DIGI to all digipeaters. Cavers simply address all packets via the path of DIGI,DIGI,DIGI,etc

If you were able to get even 1/4 mile between digipeaters, then you could use this system for up to two miles inward! Here is how I would do it:

1) Set a digipeater in the mouth of the cave which couples well, both into the main cave passage and well out to the above ground team.

2) Proceed into the cave. You can "ping" the digi at any time. When you begin to see the signal strength get low and when you make a major path change, drop a digi (I would try to hang it in the center of the passage entrance).

3) Repeat step 2 as you proceed. After each digi is installed, add one digi hop to your transmitted packet...

4) Add a digipeater on a nearby hilltop to extend the comms link back to town for arm-chair tracking by loved ones back home..

5) If the above ground comm station is at the entrance, omit the cave-mouth and hilltop digi to reduce the number of hops. Use a BEAM antenna in the mouth pointed inward.

THis APRS generic digipeating is ideal in caves because not more than a few digis will hear each other at any time. We have found that if you have many hops and each digi hears 3 or more other digis, then a packet launched to DIGI,DIGI,DIGI,DIGI could bounce around dozens of times! This is only a problem on an above ground network trying to support dozens of users. But since you will only have two or a few stations underground, even if a packet is heard a dozen times, it will not disrupt comms.

APRS works on un-connected packets. It ignores all of the duplicate copies. These multiple hops and duplicates would not work in a CONNECTED protocol. If you are unfamiliar with APRS, find someone who is....

THe only disadvantage is carrying along the laptop computer in the mud!

Areas for research:

1) How far does VHF/UHF go in a cave?
2) Is there a waveguide effect?
3) What is the best way to couple energy from one main passage into a smaller passage?
4) Can passive resonant elements be used to couple energy between main and smaller passages.
5) What is the ideal portable APRS terminal? The HP palmtops are rumored to work fine with APRS...

The advantage of APRS and packet, is that NO UNIQUE hardware needs to be developed. Everything is available off the shelf!

On Thu, 18 Jul 1996, someone wrote concerning APRS dropping
the ability to set the APRS station alias to anything but RELAY:

> This is a bit heavy handed....   dictating the procedure that
> YOU feel is the only way the system should be run.
> I will not go out and purchase TNCs for any of the sites I have control
> of, and neither do I think any one else should.   A high site digipeater
> need only have a single alias. To demand that we 'upgrade' because of
> your thinking we have gone 'out of control' is very heavy handed.

APRSdos REPLY COMMENT: My deleting the ability to set a home
station to an alias of WIDE within the program will not affect
your remote digipeaters at all. You may set their alias to anything you
want. But the standard is to have all WIDE area digipeaters also have
the secondary alias of RELAY too so that mobiles using the standard path
of RELAY,WIDE will be heard when in the vicinity of that digi...

> prose oriented please assist... I told him that I use two different
> digipeater paths when I am mobile...

> APRS VIA RELAY,WIDE
> APRS VIA WIDE,WIDE

APRSdos REPLY COMMENT: You only have to use both of these because some areas
of the country still do not have all of their WIDES converted to respond to
both RELAY and WIDE. Whereever there are dual alias TNC's then mobiles only
need to use APRS VIA RELAY,WIDE and they will be heard whether they are near
a WIDE or if they are on the fringe and just near any other APRS station
(RELAY).

Cable channel 18 is key here. Use 145.250 to find the leaks. Channel 17
works out on 144.000. This is but one way. Another is 421.25 mhz that is
channel 59 ro 60, which is also one of the ATV frequencies. You can also
use a portable tv, though less relliable, and locate the leaks.

I have a chart around here somewhere, and will send it up asap.

Line of sight, IOW not very far.

> 2) Is there a waveguide effect?

As far as the walls of the cavern are concerned, no. If you
were in a copper mine, there might be. ;-)

> 3) What is the best way to couple energy from one main passage into a smaller passage?

With a wire, strung between the two.

> 4) Can passive resonant elements be used to couple energy between main and smaller passages.

Yes; AFAIK this is the standard way of doing VHF cave radio. Rig a wire from the
entrance through your route. Splice other wires onto it for side passages. I've
never heard of anyone needing to use a repeater, digi or otherwise.

BTW, there are commercially-available caving and climbing ropes
with cables in them specifically for this purpose.

637. WIDES and RELAYS only

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 22 Jul 1996 17:58:01 -0400 (EDT)
To: aprssig@tapr.org

This weekend driving to the beach, I passed an abandoned lookout tower.
As I pondered building a solar powered DIGI there to provide mobile
coverage, I realized why we may be having trouble making people
understand the difference between a WIDE-RELAY and a RELAY digipeater...

Since the nearest WIDE is over 20 miles away we DONT NEED ANOTHER WIDE.
All we need is a digi to fill in this area for mobiles. Clearly this
new digi at 100 Feet HAAT would not be a WIDE, it would be a RELAY only
digipeater. This way, mobiles transiting the area using the standard path
of RELAY,WIDE would get picked up by this digi and relayed onward to the
existing WIDEs.

What I realized is that most people going to the expense of obtaining
and installing over $500 worth of radio equipment would think that this
effort must cleary be worthy of a WIDE digipeater. They would want it to
show as a Green star like all the other DIGIs...

..... WRONG .....

This digi should be just a DOT. I would use the "/" character. It would
just sit there on the map as a little dot with the callsign of W3XYZ. It
would digipeat packets addressed to its own callsign W3XYZ and to RELAY
(as do all APRS stations).

. . . . THATs IT ! . . . .

Yes, it is installed as a stand alone digipeater, Its on top of a very
tall tower, it looks like a digipeater installation, BUT IT IS JUST LIKE
ANY OTHER APRS STATION. It relays position reports from mobiles using

the path of VIA RELAY,WIDE... (just like any other APRS home station)...

* BUT * since it has no need to be a WIDE (because it is too close to
the main backbone WIDES), and since it is not furthering the propogation
of WIDE packets (other than out to sea in the Atlantic), it just does not
need to be a WIDE. It will clearly be seen to have reasonably wide area
coverage when ever you do a MAPS-PLOTS-POWER command, and it will provide
mobile coverage in an area where there are no WIDES and *no* 24 hour home
stations. BUT IT DOES NOT NEED TO BE A WIDE!

Making it a WIDE would potentially cut overall channel throughput in the
area by a factor of TWO (since it would repeat every WIDE packet that it
hears). Not only would this gain nothing, it would SIGNIFICANTLY reduce
channel capacity. But as a RELAY only station (Like every other APRS
station in the area) it does provide a vital role for mobiles...

Maybe we should coin a new term to designate stations like this.
To borrow a term from ground radar we could call them "Gap Fillers"
and then specify all gap fillers be set to relay only.

Being new to APRS I must ask this question....when would a station call
itself a WIDE?  I am 35 miles SW of Ft.Worth, Tx and the most APRS station
that I have ever seen in the Dallas-Ft Worth area is maybe 6-8 stations!
What purpose does a WIDE serve in a thinly populated ( with APRS stations)
like ours?  Infact even when the band is open I have not see a WIDE in
Texas.
```

Rendered body type: text/plain

In my company's infinte wisdom, they have decided to fly my rear end out to San Diego this weekend. Hopefuuly I'll find time to fire up the rented laptop and put my beacon out at nights.

Unfortunetly, I never wrote down which freq is used. Could someone please repost it for me.

On a more serious note, I plan on taking the APRS OHIO LLBBS down for good the first part of August. Activity on the BBS has equalled about one call every other day sense the last part of May.

John Baum - KB8JXO - Sysop APRS OHIO LLBBS (614) 443-4249
Cruise Missile Address: 39 56.35 N   082 58.89 W

642. LIMITED MESSAGE LENGTH CAUSED BY TNCS

From: wa4ikq@nevets.oau.org (Geoffrey Dick)
Date: Mon, 22 Jul 96 19:55 EDT
To: aprssig@tapr.org
Cc: n8chb@tir.com
Message-ID: <m0uiUop-000Qk0C@nevets.oau.org>
Rendered body type: text/plain

I received a question from Roger, N8CHB, as to what TNC was used on the receiving end, and what command in the TNC initiation file corrected limited message strings.

The TNC used was a PK88.   The following command: PACLEN 128 lengthens the message string the TNC handles, to a maximum of 128 characters, which far more than required. If more characters are in the information packet than what the APRS software is designed to handle, those bytes will simply fall out the end. With this TNC command, the message string will not be prematurely terminated.
//

From: Roger Breckon <alfred!ucf-cs!tir.com!n8chb>

RE: [APRSISIG:3198] CW, TALKING, & SINGING APRS

Then one evening we were experimenting with line lengths
> and why characters were being lost between dosAPRS, WinAPRS, and MacAPRS.

145.790 MHz is in use for APRS in So Cal, including, and starting
with, San Diego. As far as I can tell, HF is mostly on 10.151.5 Mhz.

No, not 2 meters, but 440 (at least in some geographical areas of the
country as I understand it) and the Goverment Use is RADAR.

Here in Kansas City we have some very definite topography problems.  In
particular there is an area along Interstate 29 north of the city where the lay
of the land is particularly low.  Neither the KC nor the St. Joseph WIDE digis
get into the area.  We intend to put up a "gap filler" RELAY somewhere in
never-never land to fill this gap in coverage.  This is one of those situations
where a RELAY is the order of the day as a WIDE in this area would result in too
much QRM!  Moral:  There IS a valid need for prominent digis using both aliases.

> We intend to put up a "gap filler" RELAY somewhere in
> never-never land to fill this gap in coverage.

Aren't the QTH-APRS stations the saame as "gap filler"?

We have the same problems. Here we are using, the KC5JGV-10 digi aliased as WIDE,RELAY, and every QTH Unproto path as KC5JGV-10, WIDE, WIDE. Just about every QTH has a few pounds of dirt around them, so this works very well. We have yet to have a problem with the WIDE,WIDE setup. I think it is due to the hills. I'm sure that if we were all "hill topping" we would have to work those WIDEs down a bit.

This was all trial and error on our part and I am sure it is elsewhere. I have always asked the "local boys" to use relay vs. wide to start with and see if the net works. Luckily we have a good site at 2400 feet!

BTW, Jim, are you going to the Springfield Hamfest Aug. 3rd?

653. APRS Internet server

From: wa4dsy@wa4dsy.radio.org (Dale Heatherington)
Date: Tue, 23 Jul 96 10:53:08 EDT
To: aprssig@tapr.org
Message-ID: <199607231454.OAA151891@smtp-gw01.ny.us.ibm.net>
Rendered body type: text/plain

Yesterday I kludged together a primitive APRS Internet server.
I sends anything it hears on 145.79 in Atlanta to all who connect
to tcp port 14579 from the Internet .

For Web Browsers: telnet://www.wa4dsy.radio.org:14579

For Stand alone telnet: telnet www.wa4dsy.radio.org 14579

Hit the <Esc> key to disconnect.

At this time it's set to handle a maximum of 30 users. This

number may be changed (up or down) depending on how
well it performs through my 56kb RF link. It's not too exciting
to watch raw APRS data so I don't expect too much activity.
Since this is the very first version it may be buggy or may
be down from time to time for modifications or enhancments.

This could become much more interesting when Steve Dimse
finishes his JavaAPRS. ;-)

APRSdos REPLY COMMENT: Someone needs to install a high wide area
digipeater for APRS and give it the alias of WIDE. Then you can all
communicate using just the path of WIDE. But more importantly, at its
high altitude it may hear distant packets from other areas addressed via
WIDE. Since it will digipeat these, then all of you 6 or 8 stations will
see these DX packets and can communicate with them via WIDE,WIDE...

**** To be contextually correct, please refer to this as WIDE-RELAY to
imply a dual alias digi as opposed to WIDE,RELAY which implies a VIA PATH...

> and every QTH Unproto path as KC5JGV-10, WIDE, WIDE....

**** This is equivalent to W,W,W and will have LOTS of duplication if you
have multiple WIDES in the area. But is acceptible if you dont see LOTS
of dupes due to topography...

> This was all trial and error on our part and I am sure it is elsewhere. I
> have always asked the "local boys" to use relay vs. wide to start with and
> see if the net works. Luckily we have a good site at 2400 feet!

**** Again, only MOBILES are encouraged to use the RELAY,WIDE,WIDE
path.. Fixed stations should not unless their is a specific reason
to do so..

Again, using KC5GJV-10,WIDE,WIDE is no different than using
WIDE,WIDE,WIDE.. If all you can hit is ONE WIDE on the first hop, then
that is not too bad. If you are between two wides, you can do a
WIDE,WIDE,XXXX which will get you out three hops in the direction towards
XXXX and at least two hops in the opposite direction...

MacAPRS will already work with a TCP socket via the Comm toolbox, however,
because of the non-standard port number, I cannot get it to work. I am
VERY interested in making this work correctly.

Scott and the group,

Regarding home APRS stations being "the filler" for an APRS network beneficial to mobiles, you make a valid point because "typically" they would be. However in the KC area there are very few home stations besides Jim, myself, and one or two others that operate 24hrs X 7days X 52wks. Many of the APRS users switch their stations on around 2000 local time, which limits their usefulness to mobiles. In fact, much of the time you can't count on being able to include a specific station/digi in your UNPROTO due to "station bounce".

659. APRS via internet to Atlanta!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 23 Jul 1996 13:21:41 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.960723130158.3921A-100000@arctic>
Rendered body type: text/plain

Dale WA4DSY is experimenting with an internet access to the APRS net in Atlanta. ALthough this is not the final mechanism, if you can reach your telnet service via a dumb terminal program, then you can use APRS to view the scene in Atlanta! I just tried it and saw W6PNC and WA4DSY mobiling around the city! See Dales earlier message.

Here is the ideam assuming you have a modem or LAN connected to your COMM port instead of a TNC and assuming you can access your TELNET provider using dumb terminal protocol...

Bring up APRS and perform these steps:

1) use CONTROLS-XMT to tell APRS to not send any packets
2) Access the OPS-COMM-TNC dumb terminal screen in APRS
3) Access your telent service and telnet to www.wa4dsy.radio.org 14579
4) Eventually you will see some live packets...
5) ESCAPE back into APRS and you will begin to see the Atlanta picture as if you were there!!!

NOTE: Problem is that when you use the ESC character to ESCape back into APRS, APRS sends several commands to the TNC to re-configure it for CONVERSE mode with ECHO off etc... (also ESC is used by Dale to abort his program... So when I tried it with ESC, then it did not seem to work.. (or I did not wait long enough for a packet).

Anyway, however, alt-X (un documented) will also escape you from the APRS dumb terminal screen back into APRS but *without* sending any additional characters to an assumed TNC. Use this alt-X and it will work!

If you are curious about why the alt-X feature is in there, read an old WX.TXT file about remotely logging onto a remote TNC/WX combo...

Obviously, you have to maintian thsi conection for 10 minutes or so to get a good picture of what is going on in Atlanta, and this is very inneffecient, but it deomnstrates the potential. Dale's site can only support 30 users so logg off after a few minutes to give someone else a try.

I have asked Dale to re-program his interface so that it simply dumps a current backup file to the user so that you get a full APRS picture and all screens just as if you had done a FILES-LOAD command on your PC.

I will have to modify APRS though, so that it can load a backup file from the COMM port rather than from the disk.

This way each user is serviced in a few seconds so that Dales interface can support hundreds of users a few seconds at a time instead of only 30 at up to 15 miinutes each...

660. Voice on 145.79 in Dallas.

From: "David W. McNeil" <ki5vm@flash.net>
Date: Tue, 23 Jul 1996 13:03:24 -0500
To: aprssig@tapr.org
Message-ID: <31F513EC.2574@flash.net>
Rendered body type: text/plain

```
I recieved a phone call today from another local APRS station (in the
Dallas,Texas area) to inquire if I was getting strange symbols on my
aprs screen.
Since I did not have aprs active at the time, I could not verify.
Listening on 145.79 there was a voice QSO in progress. I listened during
the QSO for a call sign so that I might possibly contact the parties by
phone. QSO ended, one party did not identify and the other party
identified with a callsign of what appeared to be KF5NTS, a call which
to my knowledge has not yet been issued, although the recieved signals
were strong the "ID" was run through so fast it was nearly
unintelligible.
Another local aprs station WX5M informed me that he has heard these
voice transmissions almost daily.
I would ask that APRS stations in the Dallas area take note to see if
these stations are in fact causing inteference to APRS and to determine
the callsign(s) of the station(s) so that they might be informed of APRS
activities on 145.79.

> Making it a WIDE would potentially cut overall channel throughput in
> the  area by a factor of TWO (since it would repeat every WIDE packet
> that it hears).  Not only would this gain nothing, it would
> SIGNIFICANTLY reduce channel capacity.

Let me pose a question for Bob and the others.

Since different areas have very different needs as far as WIDES and
RELAYs, and it seems like most users (at least in my area, and from
the sound of it, we are not in a unique situation) do not seem to
pay attention to how many wides they stick in their unproto path,
wouldn't an ideal solution be to investigate having the APRS code
itself check for duplicated position reports, etc. and not relay them
the second time if they have already sent them on once?  This would
even help out the WIDES if they were not stand-a-lone digis but rather
connected to a computer running APRS.  In other words, if someone near
you transmitted with an unproto of relay, wide, wide but since
"everybody" wants to be a WIDE, there are two (or more) within range
of each other, they would not keep repeating the packet back and forth
between them until they exhaust the number of wides in the packet.
The APRS code would have to identify each packet from its UI header
and only send on the ones that it had not already transmitted in a
set period of time.  Perhaps this is not possible, or I haven't
thought this through enough, but if somehow, each station could
filter and only send packets ahead once, then maybe we could call
all digipeaters by the same name and then everyone could run the same
unproto and perhaps limit how far their signals go by a mileage,
similar to the query function, if they desire not to show up all over
a network.

Comments?

662. WIDEs and RELAYs

From: dwetzel@uswest.com (Douglas Wetzel)
Date: Tue, 23 Jul 1996 12:45:42 -0500
To: aprssig@tapr.org
Message-ID: <1F51EE60.1262@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Hmm. After watching this discussion, and observing our new KPC-3 based WIDE, I'm now puzzled. With aliases of both RELAY and WIDE, anytime an unproto path of RELAY,WIDE appears to the digi, it repeats a packet for both RELAY and WIDE (2 packets). That leads to a couple of questions:

1. Is it normal for a digi (at least a KPC-3) with two aliases to digi twice when both aliases appear consecutively in an unproto path, or have I missed something in the KPC setup?

2. What happens if the unproto path is RELAY,WIDE,WIDE? I can find this out tonight when I go work on the machine, but perhaps someone on the sig can answer out of hand.

3. Does the overall coverage area of the WIDE influence the desirability of a RELAY alias? With mountain top digis hearing over a 75-100 mile radius, the RELAY gap-filler approach would seem to make more sense than having a mountain top (or more than one) squawking with every RELAY packet launched.

Thanks!

Hi Bill,
You will find that here in to the South there is "one" 24hr/7da/52wk station. Mine! Anyhoo, I see the two KC QTH's and mobile stations and MCI nearly everyday. Last night was very interesting in that three stations in Iowa came in hours before KC. And, of course, the St. Louis stations are booming in quite regularly.

One point, Bill and Bob, that has been left out of this on-going conversation is the amount of power transmitted at the digis. I use the MFJ data radio with all its 5-8 watts at the QTH and Mobile and an ICOM IC-22A (I think that's right) crystal 7 watt radio as the digi. Distance from QTH to Digi is 45 miles, line of sight. Anyway the point here is too much power at the digi, or QTH for that matter, can cause a lot of problems as well.

APRSdos REPLY COMMENT:  Excellent opportunity to use the OMNI-DF function
of APRS!

1) put out an APRS bulletin asking everyone to insert an APRS OMNI DF REPORT
when they hear the voices.

2) Everyone (Even if you dont hear the voices when they are active!!!)
do an INPUT-DF report.  Enter your subjective assessment of the relative
signal strength.  Entries of ZERO are equally important if you cannot
hear the station.

3) Do a MAPS-PLOTS-DF command and you will see the colored intersecting
signal strength contours.  THe black circles block out all the areas
where the station is *not*.   The area of hte maximum *intersection* of
the colored circles is the location of the voice station...

> the second time if they have already sent them on once?  This would

APRSdos REPLY COMMENT: Nice try.  APRS has nothing to do with ANY
digipeating or GATEwaying function.  That is all done by a TNC
independent of APRS.  Digipeaters dont even have a PC running APRS...

Use 145.79 with wide,wide in the unproto path. This will get you from
Mexican border to LA. There is a HF Gate available also. Here is a WWW link
to information about San Diego.

http://www.sandiego-online.com/issues/main.htm

> WIDE,   I'm now puzzled.  With aliases of both RELAY and WIDE, anytime
> an unproto path  of RELAY,WIDE appears to the digi, it repeats a packet
> for both RELAY and WIDE  (2 packets)....

**** APRS REPLY: I certainly hope not!
The TNC will only digipeat the *1st* unused callsign (RELAY).  It should NOT
hear its own transmission and therefore will not digipeat its own transmitted
packet (via WIDE).

*****  BUT, if the monitor-my-xmt is enabled (I cant find the exact
command in my TNC manual) then your TNC will hear itself and it will
digipeat ITSELF!!!!!!!!!!  Be sure this command is off!

*****  WARNING!!  Also if you use an MFJ data radio, whos receiver is
always ON even on TRANSMIT, then the TNC will also ALWAYS hear its own
packets and will DIGIPEATE ITS OWN PACKETS!  Argh!

I have asked the TNC MFRS to provide a MUTE command that tells the TNC to
never process any RECEIVED audio WHILE its PTT is down.  This solves the
problem, but I have not been able to get them to realize its importance.
It is only a problem in APRS where a TNC transmits via GENERIC digipeater
callsigns of which it is one!  This is a BRICKWALL problem in the MFJ
data radio and an CB radio.

> radius, the RELAY gap-filler approach would seem to make more sense than
> having a mountain top (or more than one)  squawking with every RELAY
> packet launched.

APRSdos REPLY COMMENT:  Not a problem, since the DIGI and maybe one or 2
home stations that also hear the original packet will usually all key
up at the same time.  Only the DIGI will be heard by 99% of the listeners...
```

If the big WIDE did not have the second alias of RELAY, though, that poor
mobile could be anywhere within the range of the big WIDE and be ignored!
since the mobile is using the RELAY call as his first hop...

From: Douglas Wetzel[SMTP:dwetzel@uswest.com]

1. Is it normal for a digi (at least a KPC-3) with two aliases to digi
twice
when both aliases appear consecutively in an unproto path, or have I missed
something in the KPC setup?

I certainly can't speak for Kantronics, but in case of the PacComm units
with multiple aliases, the callsigns are taken in sequence. For example, if
a frame is addressed via digi1, digi2 then the tnc would look at digi1 to
see if it matches any of the TNC's aliases. It would not look at digi2
callsign at all unless the 'has been repeated' bit was set on digi1.

If digi1 does indeed match one of the TNC's callsigns, it would be
repeated. Note that the TNC would not hear the repeated frame, therefore it
would not get the chance to see if digi2 is one of its callsigns.

Now if there was a digi3 following digi2, then it would take a crack at
that.

Seems to me that you should be able to use a transistor to pull the audio line to
ground, using the PTT line as the swutch. (Or, a fast reed relay.)

>de wb4apr

As a stout supporter of the proper use of WIDE's and placement I got to admit that I do disagree with one thing above, we should not assume that all WIDE's are RELAYS also.

It is not that I do not agree that a WIDE if it has the capability to act as a RELAY should it is that many TNC's will not accept two aliases. I do not know of any TNC other than the new PacComm Pico's and Kantronics KPC-3 that will do this and there are A LOT MORE TNC's out there than those two.

I for one will not go out and spend money on a new TNC just to have it handle two aliases. Many also wish to set up a digi with surplus equipment and most of this stuff is too old to even have NEMA let alone 2 aliases. Now if the TNC-2 Code (all the clones) would have dual aliases I would consider springing $15 for a new chip but that is about it. At least for me with a digi actually on the Beach in Florida the chances for a lighting strike are far too great to dish out cash for new equipment. The stuff I have up now has served for many years and has been replaced at home with more modern equipment. If it blows away in a Hurricane or get's smoked my lighting at least it will die a proud death as all amateur equipment should AFTER have serving as primary equipment.

The point is we whould not EXPECT all WIDE's to be WIDE-RELAY untill there is support from all the TNC makers for such a code. When that happens it is much more reasonable to expect someone to spend $15-$20 for a chip instead of a MINIMUM $130 for a TNC.

674. QRM Busting (was Re:Voice on 145.79 in Dallas.)

From: Arte Booten <N2ZRC@gnn.com>
Date: Tue, 23 Jul 1996 19:57:44
To: APRSSIG@tapr.org
Message-ID: <199607232357.TAA04564@mail-e2b-service.gnn.com>
Rendered body type: text/plain

Hi All,

On Tue, 23 Jul David W. McNeil wrote:

>...Listening on 145.79 there was a voice QSO in progress...

Several months ago I experienced the same situation here in the New York City area, where unoccupied frequencies are a rarity. I monitored their QSO for a few minutes until they ID'd and dropped my callsign (voice.) I then explained APRS to them briefly, said that the frequency (145.79) was used for it in this area and could they kindly please QSY. They agreed that the "bandplan" for this area lists the frequency fur use with "experimental modes," thanked me for the information and QSY'd promptly.

Of course, these two fine gentlemen were obviously licensed hams and respected the gentlemen's agreement we all refer to as "The Bandplan." There is always the possibility of running into an unlicensed individual (I'm being nice!) that will promptly chop you off at the knees with the type of language one would expect on the Chicken Band. This type of QRM'er must be handled differently.

There are two methods of doing this:

METHOD ONE

1.   Try to DF the offending stations as best as possible. Document your efforts, their transmissions, the times they operate, possibly get RF "fingerprints" of their rigs (I'm willing

to bet they're HTX-202's!)

2. Bring this information to your local ARRL Official Observer and continue documenting as above in conjunction with him/her so a case can be presented to the FCC for prosecution.

METHOD TWO

1. Whenever the offending station(s) are on the air, aim your beam at their signals.

2. As soon as one of them keys their radio, key yours with an open carrier for the duration of their transmission. Use more power than their dinky H-T.

3. When the next station starts to transmit, repeat step 2.

4. Every few minutes, give them a chance to get QSY info to each other. If you don't hear them doing so, go to step 2.

I realize this is not the "Legal" thing to do. To some it may sound childish. But I can tell you from practical experience that it is effective. If these unlicensed persons can't communicate on a given frequency they'll go someplace else. A local repeater in my area was having this problem. The pirates were transmitting 5 KHz off the repeater's input. Since the majority of this machine's users were significangtly farther north, the stations causing QRM couldn't hear that they were on the input. As I could hear THEM full scale, I blasted them off the frequency.

I did not do this "cold." I, and others, tried many times to explain the situation to them. In every instance they promised to QSY promptly and then promptly FAILED to do so. They were DF'd, monitored, logged and reported to the OO's. Nonetheless, the QRM continued. The actions I took to cause them to QSY were only used as a "last resort." If the OO's were to come to visit ME, I'd tell them I was testing my equipment and my mike must have been broken.

Perhaps this is a bit simplistic. However, drastic situations can occasionally call for drastic measures. This technique's not PRETTY but it WORKS! Here in The Big Apple sometimes we have to take matters into our own hands in order to get the desired results. This is not a genteel municipality and sometimes things must be handled accordingly.

I expect to receive MUCH flaming for this. I KNEW it'd be a hot (sorry for the pun) topic but I stand by this action. When your nets are unintelligible for weeks at a time and you have exhausted all the "Legal" possibilities, other options must come into play. Did I sink down to their level? Maybe. DID THEY QSY? YES! A means to an end. Nothing more or less.

APRSdos REPLY COMMENT: Im sure PacComm would include it in a new ROM
for the venerable Tiny-2 and other TAPR-2 TNC's if people would pay
the nominal ROM upgrade charge.   But how many HAMS would just get
one ROM and then duplicate the ROM?  I doubt that PacComm ever recovers
their investment in a new ROM release, Manual changes, and the
forever bitching from cheap HAMS, hi hi.... (grin)

PacComm, Are you listening Gwyn?  We need the dual alias in TAPR-2 ROMS
now...

The point is we whould not EXPECT all WIDE's to be WIDE-RELAY untill there is support from all the TNC makers for such a code. When that happens it is much more reasonable to expect someone to spend $15-$20 for a chip instead of a MINIMUM $130 for a TNC.

A couple of observations:

If you are talking about a dedicated APRS Digipeater, then 'ordinary' TNC EPROMs can be set up with, for example, a callsign of RELAY and an alias of WIDE to get the desired result. Then, for identification purposes, put the licensed callsign in beacon text and set it to beacon every 59 which will send out an identification frame each 9 min, 50 seconds.

Second, it is not only the PacComm PicoPacket which supports multiple aliases, but several of our other amateur TNCs also do, specifically the TINY-2 MK-2.

PacComm offers TNC-2 compatible EPROMs with the multiple alias features which will run in MFJ 1270s and 1274s and any other TNC-2 clones. Price is $30. Older PacComm units may be upgraded as well.

no flame....

        it seems that you can't cause interference to a station that isn't
there.....
        if a station isn't licensed to operate on a frequency then it isn't
there....
        although i am too old to be able to hold a mic key for a very long
period of time, and can't afford a beam, i did figure out how to set the
beacon interval to a very short interval if i should ever need to generate a
highly detailed map of a particular area. and since we can't afford a lot of
digi's, i'd have to use the high-powered mobile (maybe with the brick) to
make sure that every one of my packets made it back to my home station.
        of course, i'd make sure that i checked with all the licensed
stations to make sure that i wouldn't cause interference to them before
doing this.

Wow...

As I'm sitting here writing this, I have two javAPRS applets running, showing me the live data coming off of Dale's TNC. One map shows the southeast US, and another is a DeLorme map of Atlanta I just made.

I have sent the application and maps to Dale, he said he will try to get it running today. I'm sure he will post an announcement when it is ready. Due to the security restrictions of Java, it must be running on the same server the data is coming from, or using an applet viewer that allows you to defeat the security restrinctions. The Sun Java Development kit does allow this, many of the other viewers (including Netscape) do not.

I still have much work to do, so stay tunde for further details. The biggest omission I need to correct is that javAPRS does not parse stand-alone tracker data, and there seems to be a fair amount of this coming through the net.

Stay tuned for updates!

Steve KO4HD

> WIDE to get the desired result.

APRSdos REPLY COMMENT: Exactly. I have done that here in Annapolis, BUT only ONE such station can exist anywhere within 4 or 5 hops of another.

If two such stations are in the same area, APRS will assume they are the same station (they have the same call) and will only display the last one heard!   Actually you can get away with two of them. one as a WIDE with alias RELAY, and the other with the call of RELAY with the alias WIDE.

GREAT NEWS on the DUAL ALIAS EPROMS FOR THE TINY-2!! THanks PacComm

Hams have always been known for "taking care of there own". This means
that instead of lowering our standards to those that are causing the
problem, we "police" our own. This can be done quite easily. There should
never be a "last resort" measure. Instead of taking such measures, I
suggest taking the problem to the club, or repeater owner, at least to get
more experienced input. It appears that this was a case of
spontanious(sp?) reaction that we hams must avoid at all costs, or we'll
be just another "chicken band".

Every repeater has these problems. And they either just go away in short
order, or we "police" it. There is nothing better than seeing the face of
the interfering individual when several hams showup on his doorstep with
DF equipment in hand! Talk about imediate and final results!

First, I do believe we are generally talking about simplex here as
oppossed to a repeater. (Harder to shut em off.)

>
> Every repeater has these problems. And they either just go away in short

Yep. This is liable to be met by some guy holding a shot gun as he
answers the door(It HAS happened on one of our local T hunts...)
There are subtle, non-confrontational ways of applying peer pressure
if the individual is licensed...and they MAY respond. If this is
a chronic problem(which most are) then the subtle methods fail...and
the direct methods are likely to get you shot...so we're between a
rock and a hard place here.

Also, the FCC packed up and went away, so we don't have that recourse anymore.

Does anyone plan on attending the EAA fly-in at Oshkosh?(Aug 1-7) NASA will have several displays including a bus used to demo aeronautics to school kids. This bus includes a ham station with APRS that I hope to have on the air.

Is there any APRS activity in the Oshkosh area? What frequencies?

If any other SIG members plan to attend stop by and say hello. My wife (Nancy KC4IYD) will be at the Lewis micro-gravity display. I'm not working at the event in any official capacity (vacation - YES!) but I will probably spend some time helping with the ham setup on the bus.

Hope to eyeball some fellow hams at the show!

73,

Steve Hall - KK4PM

P.S. My wife and I will probably monitor 147.525 simplex (If its a quiet freq)

Be patient a takes some time to load. 2 minutes on this P75.
Open your Java console under Netscapes options pull down menu and you will be able to view the
actual packet from the TNC.

Congrats, Joe, you found the hidden feature!

The server seems to be fine now. The url can be simplified to:

http://www.wa4dsy.radio.org/aprs

for the wide view. There is a link there for the detail view, the direct
URL is:

http://www.wa4dsy.radio.org/aprs/DSY2.html
```

Works for me !! Netscape 3.0b5a, Win-95. At 28.8 Kbaud it takes about
3 minutes to load the map (just see a gray rectangle 'til then). Then
WOW! Cool!!! Great job, Steve!!

I'm running Netscape 2.01 32bit, and I don't do anything but click on
that URL, wait a couple of minutes for everthing to set up, open my Java
console to see the packets (not nessesary), and away she goes...

Maybe that version requires you to enable it? wish I could help.

That only appears if your browser doesn't recognize the <APPLET> tag...so
for whatever reason, your browser isn't doing Java. Don't know much about
the PC version, but in the Mac version it is possible to turn Java off in
the security options menu. Maybe it got turned off (or defaults to off)

Well Gwen was listening and it was very encouraging. As far as the copying
of EPROMS I am sure that some do it but how many people actually have the
bruners handy to make the act of "stealing" the code simple and worthwhile.
Personally I have one at work, never used it, never intend to unless it is a
must. It is not worth my time to take money away from someone else, at $30 I
hope that most of us feel the same way.

My netscrape under Linux works (mostly).  I get the multicolored Alanta
map, but I see no APRS activity.  I think that's because I'm behind
a firewall.

Open the JAVA Console, if you can.  You should see the packets coming
in, and simultaneously see the symbol show up on the map.  Only about
1/5 of the stations are within the Atlanta map, so you might have to
wait a while.  Also, the APRS symbols are camaflauged by the yellow
background, and are quite hard to see.

I have two Netscape windows open, one of each map, along with the Java
Console, and see the text come in, and the symbol show up on both maps
simultaneously.

A W S O M E !!!!

717. Follow-up to "QRM Busting"

From: Arte Booten <N2ZRC@gnn.com>
Date: Wed, 24 Jul 1996 21:09:42
To: APRSSIG@tapr.org
Message-ID: <199607250108.VAA24192@mail-e2b-service.gnn.com>
Rendered body type: text/plain

Hi again,

I realize that many of you may think my response to the QRM experienced on the repeater's input was high-handed. Let me clarify the situation.

The club's interference committee had followed "method one" to the letter up to, and including, DF'ing and confronting the offenders face-to-face. This resulted in nasty language and physical threats to the DF group.

The OO (also a club member) did all he could and followed it up to the FCC but, as we all know, they just don't care about the Amateur Service (as far as they're concerned, we're not generating any revenue so they don't want to bother!)

As you can see from this, all "legal" options had been exhausted. I've got to tell you that, at times, I felt as if I had become my own worst enemy while doing this. I'm NOT proud of it! New York City has some extremely belligerent people who will do what they want until they are stopped by using any effective method. The method I used was all they would (or could) understand.

I must also add that neither the club's officers nor members of the interference committee were aware of my efforts. I only informed a VERY select few about it AFTER THE FACT and only in face-to-face or telephone conversations. In other words, I take all responsibility for those actions and that that club had absolutely no culpability in or for them.

Thanks to all those that responded to my original posting, especially considering that I had my asbestos suit on when I retrieved the mail and found ALL the responses to be thoughtful and civil. I expected vitriol. Once again the readers of this SIG have risen above the "flame wars" I would have been subject to had this been an open newsgroup. 73

720. javAPRS next step

From: Steve Dimse <sdimse@bridge.net>
Date: Wed, 24 Jul 96 21:51:04 -0400
To: <aprssig@tapr.org>
Message-ID: <199607250148.VAA01743@bridge.net>
Rendered body type: text/plain

```
I hope everyone has enjoyed this preview of things to come. In order no
to overload Dale's server, as many people as possible should use a
stand-alone version of javAPRS. Probably tomorrow I will put a zip file
up on the TAPR upload directory with all the files needed for javAPRS. In
order to run it, you will need to install the Java  Development Kit from
Sun. This is free, and can be downloaded from:

http://java.sun.com/java.sun.com/download.html

After it is installed, run the Applet Viewer applications, find the
security options and disable them. After that is done javAPRS should run
fine.

Enjoy!

Steve KO4HD

>
Sorry for the increased bandwidth here, but I must ask or make a comment. I
know this is WAY OFF topic for the SIG but local solutions are not forth coming.
    In my area we have a few "? HAMS ?" that need to be cleaned up. There is
a situation where we have persons keying and not ID'ing CONSTANTLY. We have
a ham that is easily identified that has gone well beyond considerate
practice. Our club board is at wits end in asking them to clean up their act
(i.e. cease the actions). All to no avail. We have recordings and other
documentation etc of these happenings. In trying to raise the issue the our
local/regional ARRL rep. We've been basically told we're on our own. The
ARRL has no desire/man-power to take corrective action and it's not serious
they feel enough for the FCC to handle. We were told point blank, "It's a
local issue, you handle it". Politely asking these individuals to quite
doesn't work. Shutting off the repeater only makes them happier and
infringes on all other users of the repeater. We've been forced to disable
all extra functions of the repeater accept 911 autopatch.

    I had heard that the Feds prosecuted for hams on Louisiana with fines
for similar actions but have yet to see anything specific on how it was
done. It is presumed the local club got a court injunction against them from
using the repeater. The fine was then based not on a FCC violation but
rather a violation of a court injuction and the fine was levied by the
court, not the FCC.

  Does anyone have some acurate or usable input to this? If we can come up
with some legal or FCC backing to force the issue it would make life a lot
quieter here. If you have some specific data as to what has worked elsewhere
to permanently get these violators off the system, I'd love to hear it.

 The local club is using most of it's options. One of their last ideas was
to go to a digital PL. Although this might work, it's extremely costly to
the club ands it's member to consider doing this. We just added regular PL
this year and it created lots of problems for some members. Not everyone has
newer equipment to handle it.

Date: Wed, 24 Jul 96 22:22:32 EDT
To: aprssig@tapr.org
Message-ID: <199607250222.CAA18234@smtp-gw01.ny.us.ibm.net>
Rendered body type: text/plain

```
Wow!  You guys really know how to crash test a system.
At about 9:35 Pm (edt) here, 17 users were on the
APRS Internet server, many I assume, using the WWW
Java interface uploaded by Steve Dimse.
```

There was some trouble this afternoon involving
a memory leak which caused the server to quit
working. I've done some work on it and so far
it's holding together. (fingers crossed)

FYI:
All access to the server is through a 56kb
modem in the 222 mhz band. There is a 28.8
telephone connection on the other end of the 56k
link which limits the throughput. I hope to have
a 100% RF link to the internet provider within 2 months.
To learn more about 56Kb modems visit http://www.wa4dsy.radio.org/

The Server machine is a 486-66DX2 running OS/2 Warp and IBM tcpip.
The same machine runs JNOS in a DOS session to provide
a gateway to AX25 land. There are 2 ethernet cards
in the computer to connect JNOS with IBM tcpip and the
WWW and APRS servers. Believe it or not,
every packet you guys saw passed through JNOS 110i.

It has never been stressed like it was today. Usually
it may get one or two users accessing my home page
but 17 Java APRS users is a new record. The Modem's
TX and RX LEDs were flashing most of the time.

Don't be suprised it dies or becomes unavailable for
certain periods. This *is* and experimental system.

Have fun.

Rendered body type: text/plain

The Java APRS Internet server dies after
several hours of use. In fact, the entire
tcpip stack seems to go brain dead.
Until I can track down the problem
I'm taking the server off line.

The server machine is need for lots
of other things and usually stays
up for months with no problems.

I'll let you know when it's back.

For those of you that waited, too bad. Dale had to take his TNC server
down. Apparently it was making his system unstable. I hope he will find
the problem soon, and we can be back in business. I won't upload javAPRS
to the TAPR sig until there is a reason.

There will other servers opening soon...stay tuned for details!

Steve KO4HD

Once again, in case you missed the messages last night, the TNC server as
well as the javAPRS pages on WA4DSY's machine are down until further
notice. This is an experimental service, and apparently the heavy load
made Dale's system too unstable to continue. We hope to have this up
again soon, but no promises. There will be other servers in the
future...that IS a promise. Consider this last day a "proof of concept",
and be patient.

In the meantime, if you haven't seen them lately, check out the javAPRS
web pages, with several demos of javAPRS:

http://www.bridge.net/~sdimse/javAPRS.html

If you are interested in seeing more about the inner workings of javAPRS,
including what it takes to add it to an html page, check out the paper I
submitted to the Digital Communication conference:

http://www.bridge.net/~sdimse/dcc.html

I just did a Yahoo search on APRS.  Last time I did this, I got about 50
matches and most were APRS.  This time I got 750 matches and most were the
Association of Professional Research whatevers...   I guess as more and
more web pages come on line, this was inevitable...

    Although I could search on WinAPRS or MacAPRS, or APRSdos, that is
not the point...  the overall APRS name is much preferable as
distinctions between platforms will become blured...

I know that you can use the AND function in a search to be more
specific, but unless we have a commonly know modifier, this doesnt
give the unique distinction that is needed...

Anyone have a good idea how to make APRS itself stand out better?

APRSdos REPLY COMMENT: Well, the obvious APRS + PACKET or APRS + POSITION
are good ideas. Originally APRS was the AUTOMATIC PACKET REPORTING
system, then I changed it to AUTOMATIC POSITION REPORTING SYSTEM, so these
will give inconsistent results.

How about APRS + RADIO?

How do the Search engines decide on the key words? Could everyone that is
doing an APRS WEB site be sure to use the key word RADIO somewhere in
their topics so that this APRS + RADIO would always work?

I sent almost all the chips I ordered, that's more than 50!
If you didn't participate in the group purchase, please don't send any money
to buy some, I won't be able to provide them. Send me an email FIRST, and
i'll see what I can do (I still have a couple of orders pending, if they
don't come I'll have some MAR-6 available...)

I eventually got the time to put together a short "how to" for the GPS pre-
amplifier, project with a PCB layout.
It's available on my web page at:
 http://rock.seism1.ess.sunysb.edu:8080/hobby.html
Please see this has a first draft, certainly not perfect. I would really
appreciate any feedback on it, especially if I made a big mistake.

I would prefer you don't post it on any other web site for now. It will be
freely available after correction and improvements. Do not link my page
either, the server is going to die soon.

I built a prototype on a patch antenna and it works quite well. I didn't
find any suitable double side PCB, so this is not perfect, but it's
definitively worse it. If someone has a source of double side G10 PCB let me
know.

Bernard, KB2TGH.

Was it Magellan instead of Yahoo that gave you that?

I tried the search engines available under netscape:

Yahoo: 2 hits only, but both related to APRS
Infoseek: >50 hits, majority related to APRS
Lycos: about the same

Magellan: >50 hits majority related to "Association ...P R whatever".

Nobody is likely to go further than the first 100 hits, if you are after that it's useless.
Actually this is not that bad at all, except for Magellan.

>Anyone have a good idea how to make APRS itself stand out better?
>

This is not easy. It involves understanding how the search engines analyse the information in a page to construct the database. None of the search engines I look at would give an explanation on "how" they do that. It is automatic for sure, Lycos even says the method is "patent pending".

A few tips:

You can add your pages yourself to the majority of these search engines. It's not a guarantee of listing, but a good start. The help section of the search engines explain how to do that.

Everyone putting a page related with APRS should have APRS appear on the page(!). Put APRS in the title of the page too (i.e. the name of the should be like: <title>APRS blabla</title>). Put it as headings 1 (<H1>APRS...</H1>). Make it proeminent.

Someone searching for APRS, is likely (if there's no match) to add "AND radio", "AND packet", "AND packet-radio", "and HAM" ... Be sure these words (or other relevant keywords) appear in the page too. APRS-dos, Win-APRS ... are better than APRSdos or WinAPRS, the hyphen make them 2 separate words.

Even if it is not the object of the page, a short introduction about APRS at the beginning of the main APRS page is likely to contain lots of keywords, and will be listed as abstract by the search engine.

Put your aprs pages in a subdirectory named APRS, may increase the chance of listing (the "Association P R...whatever" is always listed in a sub dir .../APRS/...).

Be sure your pages remain accessible all the time, they are checked periodically. If your change the URL, submit the change to the search engine. The search engine will find and list EVERY page linked to your page (so submitting the main page is enough).

If your add your page to one search engine the other one are likely to catch it soon!

The logo APRS is not bad by itself: this is not an usual word.

Try to find -my- pages with a search engine. My last name is a very common french word (it's a form of "to be") and appears every other line in any french text: you'll see how a search engine can be stupid. Now that I added myself (what an ego!) to a search engine I'm there, :-).

Bernard, KB2TGH.

These "key words" are determined by the people creating the web pages. You have to
specifiy desired key words when submiting your URL to the search engines.

i.e.

URL= http://home.navisoft.com/agrelo/ae.htm
KEY WORDS= DFjr, transmitters, etc.

Key words could be: Automatic Position Reporting System, APRS Radio, APRS Packet,
APRS Telemetry, ETC...

It would be difficult to convince everyone, especialy new comers, to use anything
but APRS for the search. Unless..from today, everybody in the world starts calling it
"APRS system" and still, I think people will tend to search on APRS only.
After all...you want people to find APRS who never heard of it before. Those of
us who are fluent APRSers know the difference between what ever else it stands for
and the real McCoy.

Well...just my two cents worth, not a penny less or a penny more, and you know what
that'll get ya;-)

741. Rain Gauge

From: Steve Sable <ssable@ic.net>
Date: Thu, 25 Jul 1996 14:42:25 -0400
To: aprssig@tapr.org
Message-ID: <m0ujVNO-003FaAC@ic.net>
Rendered body type: text/plain

```
I am confused with the readings or how to read my rain gauge with the
Ultimeter 500. The gauge's that were avail were the "self emptying"
1/100 or the 1/10. I got the 1/100.
The 500 display read's right now 0.00in. If the amount of rain showed
0.04in on the 500, how would you read this? Would it be 4 one hundredth's
of an inch or 4 tenths of an inch?
Do I need to change the display the on 500 to read 0.0in instead of
0.00in?
====
Does Peet Bros have their web page up yet?
```

I have mentioned this to Steve, that he needs a 32 mile map top see all of
us (and the DIGIS), but he doesn't know what a 32 mile map is.  It means
nothing to a Mac User.  I'll send him the DOS GA-ATL.MAP and he can use it.
Then you'll see all of us.

I was thinking he could snapshot a map like he has been using, but just make
it a bigger radius.  You are right, though about the DeLorme maps being
really "busy" tho.

I'm sending him the map now.

APRSdos REPLY COMMENT: IN APRS, the display is always the same /Rith

Where "i" is inches, "t" is tenths and "h" is hundredths.  But the count
that APRS gets from the ULTIMETER is simply just a numerical count of
hits.  That is why you have to tell APRS whether each count meants tenths
or 100's instrument....

Search engines get their ques from the author of the page. That is when
the page is created the author can specify in the document topics which
when the page is registered with a search engine are what are used to
create indexes that the search engine will use during a search.

So it seemd to me that the pages already out there would need to be
edited to include a consistant reference topic, maybe
Amateur Radio + APRS or APRS + GPS or something along these lines.

But first an agreement on topic name/title should be discussed and pinned
down here on the SIG.

In AltaVista the syntax above results in searching for all docs
containing Packet, and the results are prioritized by the other two
words. A plus sign means to be found it must contain that word, and
phrases must be in double quotes. The search you meant (I think) would be:

+APRS +"Packet Radio"

Which finds all docs containing both APRS and the phrase packet radio.

+APRS +Packet +Radio

would only find docs containing all three words.

+APRS +(Packet Radio)

would find docs with APRS and at least one of packet or radio.

This is my favorite search engine. All the instructions are on line. BTW,
this is the simple syntax...there is a more powerful advanced search!

761. javAPRS rides again

From: Steve Dimse <sdimse@bridge.net>
Date: Thu, 25 Jul 96 20:42:53 -0400
To: <aprssig@tapr.org>
Message-ID: <199607260040.UAA24785@bridge.net>
Rendered body type: text/plain

OK, we're ready to try again.

Dale feels that the problem was due to the load of WWW server and javAPRS. Therefore, only local applets will be able to to access the server. This means you will not be able to use Netscape to access the data.

You must get the Applet Viewer from Sun...as far as I know it only comes as part of the Java Development Kit. Here is the URL:

http://java.sun.com/java.sun.com/download.html

Once this is installed, you will need to turn off the security features. This is accessed in the properties dialog, under the File menu on the Mac. You others are on your own. Then, you will need the javAPRS package, at this URL:

ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload/javAPRS.zip

Unzip this, and run any of the three HTML files in the Applet Runner. Each of these will display a different map:

atlanta.html is the DeLorme detail of Atlanta
seast.html is the wide view of the Southeast US
ga-atl.html is a medium view (I'm told it's a "32 mile map") of the greater Atlanta area. This is the best place to start.

Please only run one file at a time, in order to keep the load on the server reasonable.

Enjoy.

> 0.00in?

4 One Hundredths of an inch is correct, and you don't need to change the display.

I'm glad you posted, I was meaning to post something myself (actually tried earlier this evening, but my provider dumped me)

I recently added the .1 rain gauge to my Ultimeter II. I do not believe that APRS is displaying rain info properly. Bob, can you clear things up for me.

Rxxx is for rain in the last hour (as per the docs) The values for xxx are, inches, tenths, and hundredths

Pxxx is for rain for the last 24 hours (same values)

Does APRS keep a time value for EACH click?
Does APRS delete one click from the R field when that time value exceeds 60 min? Or Does APRS keep track of all clicks for 1 hour and then re-set to zero for the next hour?

According to how I reed the docs, the P field is the amount of rain for the last 24 hours. Yet when we had a rain storm a few evenings ago, by the next morning the P field was down to zero (a lot less than 24 hours)

==

```
Following comments are for the AutoWX program (Bob, is not the author but
he has posted here before)

We have one local user of AutoWX (WB1F, Melrose, Mass) and HIS rain
reports are NOT to APRS standards!  Instead of inches, tenths, and
hundredths HIS reports are tens, inches, tenths.

I know, because our two WX stations are only about 12 miles apart and
I've looked at both during the last storm. (it was a general rain and
there would NOT be a tenfold difference in actual rainfall)

Anyone else notice this?

Date:    7/25/96 9:38 PM

     Steve,

     Way to GO!

     I downloaded the JDK and installed it, then downloaded your stuff
     from TAPR.

     However, when I unzipped your files, two things happened:

        1       Using pkzip204g, I see that I needed the -d flag to
                maintain directory structure.  Had problems with
                8x3 filename vs what your code was looking for....

        2       So, I download the UnZip program referenced in the JDK
                download instructions and tried again.  Still had the
                problem with 8x3 file names in the javaprs subdirectory.

     Both 'extracts' were onto NT machines running NTFS for long file name
     support...

     So, using the error messages from appletviewer as a guide, I
     eventually renamed all of the .cla files to .class, changes all of the
     files containing *pars or *par or *parse to *parser, and finally
     changed paramete.cla to parameters.class.  Whew!

     Maybe you can find a version of some zip tool that maintains long file
     names and re-upload the files?

     Aside from these minor problems, WOW!

     Don't the people in Georgia ever sleep?  It's 9:30 PDST as I write
     this and I'm still getting updates.

There is a paper by Dr. G.L. Mader of the Geosciences Research Division , NGS, NOAA discussing the calibration of GPS antennas.

The research was used to develop mapping functions to allow the mixture of different antenna types. Large errors in the vertical result when mixing antenna types without such a capability.

The URL is www.grdl.noaa.gov/GRD/GPS/Projects/ANTCAL/antcal_toc.html.

765. javAPRS zip problem

From: Steve Dimse <sdimse@bridge.net>
Date: Fri, 26 Jul 96 02:38:41 -0400
To: <aprssig@tapr.org>

Rendered body type: text/plain

I'm told there may be a problem with the zip file I uploaded to the tapr ftp site. Apparently the program "WinZip" truncates the file names to and 8.3 filename. Last time I had to deal with an 8.3 file system was 1984, when I left CP/M for the Mac (how do people live like that???) Anyway, I need some help.

1. What do the class files look like on the Windows version of Java (mac uses .class)?

2. Is there some other Windows zip file that would preserve the full file names? (I've heard a rumor that now Windows has long file names...)

3. If you change the classes to .class manually, does it work then?

For now, I'd like to hear all success and failure stories (emailed to me direct to save bandwidth, please). I'll share with the sig what works and doesn't.

Thanks de Steve KO4HD

>
>   Aside from these minor problems, WOW!
>

OK, I found the problem. It turns out there is a hidden option in the zip program I was using that truncated to 8.3 filenames. It is fixed now, a new version is up on the TAPR server. Sorry for the problem, thanks to Ren Roderick for pointing me in the right direction.

Have fun...

Steve KO4HD

AutoWx does report in tenths only (up to 999 tenths) and has been
fixed as of version 3.6   I never noticed the change (?) in the
report format because here in West Texas, rain is mostly a
theoretical phenomenom.

APRSdos REPLY COMMENT:  The WX station outputs the current rain count.
APRS has a buffer of 6 values for the per-hour count and every 10 minutes
saves the new value on the end and throws away the oldest value.  The rain
per hour is the difference between the latest value and the oldest value
(one hour ago).  Same thing for the P  value, except that it keeps 24
```

hourly values...

To the APRS sig

The last time I went away and did not respond for a week, rumors started to circulate that I (we) had been kidnapped.

I am going to be out of town for the next 2 weeks and when I get back I am sure its going to take me at least a week to get caught up on email.

Keith will still be around and will be able to answer most questions, please send any registration questions to him at ksproul@noc.rutgers.edu

You can expect the next release of WinAPRS around the end of August.

Mark

I just got WinAPRS 1,1,2 up and running as a standalone tracker with my Garmin 45. It seems to work OK but the placement ofmy position seems to be off. Most of the time the position reported by the GPS shows up on the map as .8 to 2.5 miles west of my actual position. This happens both with WinAprs maps and with my own maps, made for DOSAprs using mkmap.exe. The Garmin is outputting wps84 datun format. What's wrong here?? Thanks for your help.

16 bit Netscape does JavaSCRIPT, not Java. Only the 32 bit runs true
Java.

> 16 Bit operating systems.

Correct...the 16 bit version of Netscape (2.0 or later) works with
JavaSCRIPT (created by Netscape), but NOT with Sun's Java. Also: check
OPTIONS - NETWORK - LANGUAGE and be sure JavaScript is checked (both
Java AND JavaScript in the 32 bit versions) or it won't work.

The beauty of JavaScript is that it allows client side processing
instead of running the Java processor on the server. It's also not
capable of everything Java does...yet.

Jon,

My guess is that you should be out putting NEMA 0183 V1.5 (NEMA/NEMA) 4800 baud.
This is a semi-educated guess beacase I don't know which Garmin you have.

I made the trip I had planned across the country and have started working
at the new job.  I had originally planned to use APRS and hod a nice setup
for it; however, when I stopped to fill-up at 100 miles into the trip, I
discovered that I had just a wire stub where a Larson 2/70 on a mag mount
had been. (That makes $240 worth of antennas and mag mounts lost to paper
bags, tree limbs and who knows what.  I've lost three sets.)  Oh, well. As
a result, No APRS operation on this trip. Many thanks to those who
responded to my initial posting about making the trip.

We are indeed working on a X-Windows/Unix/Linux version.

We had a demo running at Dayton with X-APRS running on a SUN. At that point
the only thing that was working was the maps. But we ARE working on it. At
this point we are NOT promising any dates...

Does not the phrase "standalone tracker" typically mean no computer
involved? Don't you really mean "mobile APRS station" if you have a computer
connected?  Not to be nit-picking mind you.

How well does APRS run on an HP200? Obviously, lots of maps are a
problem.

>Garmin 45. It seems to work OK but the placement ofmy position seems to be
>off.

The problem lies in the Map Datum used to create the map. You need to set
your GPS reciever to whatever mapdatum was used to make the map. Someone
made a program to update old maps to the new map datum but I forgot who . . .
anyone from San Diego Remember???

Steve or somebody, please (Karla cleaned house yesterday) all of the prints of the messages of accessing the Atlanta APRS Internet site were lost! Could somebody put up the URL and the Java Information again?

I was finally motivated to work on and get Dial-Up Networking to function tonight so I could use Netscape 2.01 just to look at this experiment....

Special notes and help will be appreciated! Sorry to waste bandwidth due to repeats....

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

-> 73, doug

Hi Doug,

I have run APRS on my 200LX, and it runs pretty well in dedicated DOS mode. The maps can take a little while to draw initially. Also the aspect ratio is a little off due to the screen's width/height ratio.

I have 16 Mb of flash ram for a HD, so the maps are not a problem. I have the standard USA set plus detailed Alabama maps. Of course you could only have the map(s) you REALLY need loaded.

That's correct. Don't forget the :8080.
The server used to crash every now and then, but it seems stable now.
If someone cannot connect, try to report any indication that may help fix a
possible problem (i.e. unable to connect, server not in DNS, page not found,
waiting  ...).
The network is known to be quite slow on Long Island, maybe you need to be
patient: but that shouldn't prevent connection.

I'll post the file to the TAPR ftp server.

#1
I saw a most unique antenna array today and thought one of you could help. I would describe it as a plexiglass looking jellyfish shaped thing, but not like a parabolic dish but 4 small (<2ft diam) plexigalss thingies. shaped like bells .They were poiinting DOWN to the base of the antenna .
Any clue ?

#2
GARMIN GPS 45

Drove about 1 hour and the 45 just locked up. No sats, but all functions normal, did not track. It was cool in the car (at night with air on) but I had the internal GPS light on. Shut it off, rebooted, nothing. Parked the car, ate and came back and in the same spot, turned it on, and 6 sats came on line...Weird...

Here is my pico config for standalone weather with a U-2000 just change the gpstext value to that of your NMEA string Like $GPRMC and also the unproto and lpath values.
Most of all make sure to run the baud command for the second port and set it to 4800 as well as making sure the garmin I/O is set to NMEA and not garmin protocol.

I've had this occur when my transmitter densed the Garmin input. If you have any kind of transmitter in the car watch on the sat display of the garmin and if it's overload the sat's will just dissapear at the time of transmission.

797. Another Stamp application

From: KD4EMI@aol.com
Date: Sat, 27 Jul 1996 15:40:33 -0400
To: aprssig@tapr.org
Message-ID: <960727154032_586209599@emout17.mail.aol.com>
Rendered body type: text/plain

I was thinking...Wouldnt it be neat to leave my tracker in the car without having to go thru an ordeal to turn it off etc..
SO...
I put my stamp to work.

Now, when I leave the car, I hit DTMF tone 1 on my HT, which resets the TNC to beacon every 15 minutes.

When I get into the car, I hit 3 and it resets the tnc to xmit every 5 min and resets the unproto for wide,wide and unproto 2 for relay,wide.

Kinda neat...

Ive had multiple inquiries about the lightning stuff. 2 problems

#1 The lightning monitor I got from AOL wx store stinks. You need a VLF ground to make the thing work. Tough...I live in an apt...hard to start running coax down the wall. (I already get away with HF LOOP and small tower plus Ive had beams up there from time to time) Ive had bolts hit within 2 miles...nothing...My old crummy one works better. When I get some cash, will look into the hand held device.

#2 SOFTWARE
I gotta learn how to write software..I understand that APRS is in quickbasic (?)... I wont get anywhere without some software. Basic stamp and lightning stuff starts getting expensive. Need to get some software to get this thing working correctly. (maybe a tsr over aprs?)

So there it is..the software for the stamp is easy..If youve got one you know how to read the dtmf tone and xmit the computer stuff to change the tnc params..

798. New javAPRS features

From: Steve Dimse <sdimse@bridge.net>
Date: Sat, 27 Jul 96 18:16:16 -0400
To: <aprssig@tapr.org>
Message-ID: <199607272213.SAA15384@bridge.net>
Rendered body type: text/plain

A new version of javAPRS is up on the tapr server.

The new features are the ability to use pgup (or U), pgdn (or D), and arrow keys to zoom in and scroll the map. Also the L key will dump a station list to the java console window.

Before these are active in Netscape you will need to click on the map, so that the applet is made active and receives the keypress events.

Rumor has it that Dale may be able to bring the html server back up soon, which will again allow viewing without the stand alone applet runner.

Not to steal anyone else's thunder, but look for another source of
(almost) live data on the internet soon...

Steve KO4HD

Message-ID: <19960727.175120.11943.0.kf4dys@juno.com>
Rendered body type: text/plain

Greetings all;

I am the ARES Tropical Cyclone tracker for the EPAN APRS vhf net, in
the
Florida Panhandle.

This is a new net, with only a few stations at this time, so as an
exercise, I tracked Bertha, from the first, to the final NWS advisory. In

the process, I encountered several problems

To ensure that data can move back and forth between the EPAN net and
the
WPAN net, I have been discussing problems and coordinating the solutions
with Hank Holt ks4ny, the AEC for Santa Rosa County.

Problems encountered in the EPAN net:

1) Proper use of Tropical Cyclone symbols
2) Selecting a path
3) APRS software malfunctions
4) Acquisition of NWS data
5) Distribution of NWS Advisories
6) Interference by other stations
    a) accidental capture of locally posted object
    b) map cluttered with unnecessary data
    c) different data posted by other stations

1) Proper use of Tropical Cyclone symbols;

Being new to APRS, I initially was using the standard Advisory Flag
symbols, one flag for a Tropical Depression and two flags for a Tropical
Storm.
Hank guided me to understanding the modified Hurricane symbol, as used

for all levels of Tropical Cyclones.
Accordingly, any time I am tracking a Tropical Cyclone, you can expect
to
see the Hurricane symbol. The symbol will be Blue for a Tropical
Depression,
Yellow for a Tropical Storm and Red for a Hurricane. Additionally, the
symbol will include Range Rings, indicating the areas where high winds
can
be found. Hurricane force winds (above 64kts) will be inside the Red ring

and Tropical Storm force winds (above 34kts) will be inside the Yellow
ring.

2) Selecting a path;

Since EPAN has a single digi, located in the approximate center of the

district, this would not normally be a problem. However, at the request
of
ks4ny, I was also posting the tracking data throughout WPAN, during the
day,
when their designated Tracking Operators were at work.
For reasons stated later in this report, I did not use any WIDE's in
my
path.
The path KD4TOK-7,W4NN-1,KS4NY-7,W2GFF-7 turned out to be reliable
enough

for use during the early afternoon, when propagation is at it's poorest.

I posted Bulletins, requesting that I be informed if I was causing interference, by using this long path, and there were no responses.

When providing tracking data for just the EPAN net, KD4TOK-7 is all the path that is necessary.

3) APRS software malfunctions;

There were two minor problems in this area.

First, my station would stop transmitting the Bertha data, when the Positions page filled up. This problem was eliminated by registering the software and installing the validation number.

Second, the software would stop responding to the left mouse button, after more than five hours with no keyboard entries. This interferes with zooming and hooking. Since the <enter> key can be used for the same purpose, this has only a minor effect on the operating technique.

This problem was common to versions 7.5c, 7.6d and it still happens in 7.6f. Validating the software did not eliminate this problem.

4) Acquisition of NWS data;

During the exercise, it was reported to me that access to the NWS Internet web pages, on the NHC site, had been restricted. Since I was not using the web page links, to obtain copies of the NWS advisories, this was not a problem.

5) Distribution of NWS Advisories;

With so few local stations, initially, the most recent NWS advisory was maintained as a bulletin in my TNC's mailbox and a bulletin announcing that, was posted on APARS.

As the more distant stations, using a long path, accessed the advisory, it became apparent that this was interfering with the net's normal use. I then designated an (O)ps (D)igi path, posting the bulletin on the local net only and that interference stopped.

Since then, many of the stations in EPAN (including all the APARS operators) have gotten on the Juno e-mail server and the DEC has instituted an EPAN Mailing List, which is used to distribute the NWS advisories. I no longer maintain the most recent NWS advisory in my mailbox.

6) Interference by other stations;

During the evenings and the early mornings, when propagation was at it's best, I normally, directly receive stations from northern Alabama and Georgia, through central Florida. During band openings, I have seen stations as far away as Canada and Haiti. When the net is being used solely for entertainment purposes, this is fine. Unfortunately, this causes some problems for local use.

a) accidental capture of locally posted object;

This was the most common problem, throughout the exercise. During the evenings and the early mornings, when propagation was at it's best, my posted storm was repeatedly being captured by distant stations, who were also posting the storm.

Initially, I tried to eliminate the reception of these distant stations, by reducing my receiver sensitivity. This was a complete failure, as most of the distant stations were indiscriminately using WIDE in their path and the EPAN digi would also repeat the packets.

WA8INZ demonstrated a simple solution, by appending the advisory number to his object name. A unique object name prevents accidental capture.

I now append "P" (for Panhandle) as the ninth character in the object name for all Tropical Cyclones.

b) map cluttered with unnecessary data;

Distant stations, not being in the direct and immediate path of the storm, have a tendency to post additional and unnecessary data to the net.

This is completely normal and will probably always happen. After all, the best time to experiment with alternate methods of reporting, is when the storm is not coming your way. That way if something doesn't work out, you won't interfere with local preparations for the upcoming disaster.

During the evenings and the early mornings, when propagation was at it's best, undesired data would show up from distant nets, contributing to a confusion of information on the local net displays. Again, the indiscriminate use of WIDE in many distant stations' path, contributes enormously to the interference.

Since the reception of packets from distant stations is usually intermittent, an alert operator can easily capture and (K)ill the undesired posted objects. By using a specific path for just the local net, this should maintain the local net at maximum usability, while continuing to permit the distant nets to experiment with alternate methods.

I noticed that my software was not allowing the displaying of new incoming Bulletins, when the Bulletin page was already full. This appeared to be a problem even after validation.

Routinely erasing the Bulletins with Alt-E prevents this from happening. If anyone knows how to erase individually specified Bulletins, instead of the entire page, please let me know how.

c) different data posted by other stations

Distant stations, not being in the direct and immediate path of the storm, have a tendency to fail to perform timely updates to the data, that they are posting. Sometimes, data would come in, from distant nets, that was as much as 24 hours old. Since very few Tropical Cyclones read the NWS advisories, they do not normally follow the predicted path.

During the evenings and the early mornings, when propagation was at it's best, old data would show up from distant nets, contributing to a confusion of information on the local net displays. Again, the indiscriminate use of WIDE in many distant stations' path, contributes enormously to the interference.

Again, an alert operator can easily capture and (K)ill posted objects from distant stations.

This problem, if combined with the problem in 6)a), could have disastrous effects in an area using a local net to prepare for an imminent Hurricane.

If you think I exaggerate how critical this problem could be, just imagine what it would have been like if during the final 12 hours before Opal's landfall, the Panhandle had been using 24 hour old data in making preparations.

Suggestions for future operations:

Since the indiscriminate use of WIDE directly contributed to the interference problems, I recommend that all operators, throughout the APARS community, develop the habit of avoiding the use of WIDE, whenever possible.

Admittedly, it is necessary for mobiles to use WIDE and digis should also use WIDE,WIDE to give maximum spread to their IDs and beacons. Base

```
stations,
however should tailor a specific path for whatever their needs are,
avoiding
all use of WIDE, whenever possible.
   Even more important, stations transmitting data packets that relate to

disaster preparations in another net, should *NEVER* use WIDE in their
path.
Additionally, all individual base stations, east of the Mississippi,
should
remove every WIDE from their path, several hours before any Atlantic
Tropical Cyclone makes landfall.

   The local net will find it advantageous, to have one operator
designated
to capture and kill, all distant station data, from the local net, during
the
final four hours prior to landfall of the Tropical Cyclone.
   If the Tropical Cyclone makes landfall in the late afternoon, then the

designated operator will not have much to do. On the other hand, if the
Tropical Cyclone makes landfall during the hours of darkness or anytime
up
to mid morning, then the designated operator will be critical to
maintaining
a local net, free from confusing data.

Joe Foor kf4dys
Florida ARES
East Panhandle District
Tropical Cyclone Tracking Operator

I am having problems with the stamp reading the GPS data.
Not sure why. One comment, stamp support is tough to get. They are pretty
busy lot there.
Though this is a great idea. I also thought the frequency of the xmits can be
decreased as you slow down.
Mike

If you have a stamp in your car you only need to have it watch
the $GPRMC String that the GPS is sending out {if you are in
fact leaving that on all the time} even when you are out of the
car.

If the Stamp detects a 0 MPH then it can change the beacon to
```

15 minutes and if it sees a speed > 5 MPH it will go into the
3 minute mode and change the paths for you. DTMF is still a
good idea and you should not eliminate it!

This way you maximize the intelligence of the stamp. The only thing that is
wrong is you need to eliminate the RELAY,WIDE
which does absolutely nothing and just keep it at WIDE,WIDE.

In South Florida everything will be a WIDE to generate maximum
signal thru put by means of the digipeat concept.

Hi Mike

I have a similar application but use a 'Domino' from Micromint. This has
much better performance than the STAMP and costs are similar. I use it to
take the GPGGA and GPVTG data from my Magnavox GPS unit and synthesize a
GPRMC sentence which is much more effcient for use with APRS. Obviously, the
Domino has no problems with reading the GPS data as it must do in this
application. I am at present working on just such a system as you described
to reduce the transmit rate when the car is parked. If anyones interested I
can put the source code on my home page. But it is pretty simple!

I have no connection with Micromint but for $79, 10 i/o bits, 32K ram, 32k
EEPROM its a pretty good unit!

RE MELBOURNE HAMFEST:

There is a Mcdonalds (large) just down the street from the hamfest. I will
be attending it and hope to see you guys there. I will be operating HF and
VHF mobile on the trip up (at least VHF for sure).

Lets nail down a time and place..

How about in front of the hamfest at 12 noon and then go to MCdonalds or play
it by ear from there...
Also, some kinda distictive thing to wear to recognize fellow aprs's would be
neat ...
```

Any suggestions ?

I've put the APRS server back on line. Direct your Java enabled browsers to:

http://www.wa4dsy.radio.org/aprs/

It has been known to stop sending TNC data for no reason
so be advised that it's still being debuged. If you don't see
any activity for 2 or 3 minutes it's probably gone brain dead.
The max users is still 30.

Have fun

Dale Heatherington, WA4DSY
e-mail - wa4dsy@wa4dsy.radio.org
e-mail - daheath@ibm.net (in case the first one doesn't work)

WB0WNX-7 will be operating airmobile from Sioux City, IA to Kansas City, MO
this Tuesday. Departure from SUX will be approx 0730L. Cruising altitude
will be 17,000. Path is APRS VIA WIDE,GATE,GATE,WIDE every 30 seconds on
145.79 running 10 watts into a rubber duck suctioned to co-pilot side
window. GPS is a Motorola Encore with the puck thrown on top of the dash on
the co-pilot's side. Return to Sioux City will be approx 1900L (depending
on how much dinner I eat) at 16,000 ft. Requests copies of ground tracks
and your home QTH Lat/Long to get an idea of how far I can reach.

---------- Forwarded message ----------
From: John Rothert <rothertj@digital.net>
To: sarex@amsat.org
Subject: SAREX For The Deaf

        I am currently working with a group of deaf students here in central
Florida call New Friends.  It is a non-profit organization for deaf and
hearing impaired children. The function of the organization is to provide an
atmosphere where deaf children can meet to socialize and share learning
experiences. When you first think of Amateur Radio you think of Voice and
CW, but we have many modes that could be used by hearing impaired. Radio
Teletype, Amtor, Packet, Pactor, TV and even CW could be a means of
communicating via Amateur Radio for the deaf. Now with digital read out dial
displays, tuning to the proper frequency is no problem. I have been involved
with the SAREX program here in the central Florida since STS-35, and thought
this would be a great project to get these kids involved with. Last year we
summitted our application to ARRL and the SAREX commitity to have a
scheduled possible Packet contact with one of the up coming missions. As I
understand it NASA is interested in this project and we may get our chance
on a future mission. Some of our student objectives are:

A. Learn about Space Science.
B. Show how computers can help you communicate.
C. Learn about the Internet.
D. Spark interest in Amateur Radio.
E. Communicate with the Space Shuttle.

        If any of you know of any deaf Hams please let me know how I can get in
touch with them. I am sure the kids at New Friends would like hear about
them. I am also looking for any idea you may have that would help make
Amateur Radio more exciting to these kids.

73,
John

>neat ...

How about a page from a street or road map using different colored push-pins to attach it to the back of your jacket :-) Sorry, I just really couldn't resist that one.

I do have a serious question about APRS that a friend has posed. Is there some filter that could be set on that would only display stations heard directly, i.e., not digi-peated. I know that this defeats the general purpose of APRS, but he has suggested a sort of unique application.

He is a heavy VHF/UHF user, and wants to use it as a way to track and plot propagation conditions, and to alert him of band openings to a particular area. Sort of a DX-mode type of operation, but directly heard, and for VHF.

Does anybody have any suggestions?

Thanks to all you did respound to my request. Unfortunately Mr Murphy was working overtime. My orginal message out of the service I used for E-mail did not hit hear until Monday 7/22. I was already in S.D. by then. A quick call to Ham Radio Outlet did let me know that APRS was on good old 5.79.

The rental lap top and TNC did not get along at all. By looking at the LED Bar on the hand help, I had to be within eyeball of a relay or wide, by two nights of putzing drew no luck on the comm problem, so I threw it in, and speent the evenings watching the sun go down over the Pacific instead.

joe FOor kf4dys gave some excellent problems and solutions for operating an APRS severe weather net for REAL. He seems to ahave a very good grasp of some of the obscure techniques built in. Only one thing that he didnt mention was the consideration to use an alternate net. APRS has two features for isolating operations from other operatsion on the same frequency

1) alt-SETUP-MODES-SPECIAL sets yyour station to send all packets TO SPCL and to ignore all other packets on freequency ECEPT those to SPCL. There are two aspects of this:
   a) All other APRS stations WILL see all of the data to SPCL
   b) All of the SPCL station only see each other but can receive MSGS from outsiders
   c) But if other remote areas also use SPCL then you will still see them TOO

2) alt-SETUP-MODE-altNET Same as above with the following additional differences:
   a) You can uniquely NAME your altnet
   b) No one else on frequencey OTHER than your group will see you
   c) You will see no one else
   d) Im not sure if you will receive incomming messages or not

NOTE: !!! These commands are from memory, so Im not exactly sure 0f the exact command, but they are in SETUP somewhere...

3) What happens if you BUDLIST out WIDE? I think the filters in the

TNC's only BUDLIST the FROM and TO calls, and you cant filter out the DIGI path?

TEST THESE, They have been little used, and may not be perfewt...

Rendered body type: text/plain

Concerning what to use for APRS AERO mobile...

YOu would be SHOT if you used RELAY, hi hi..... YOu would be keying up every radio in hundreds of miles for NO ADVANTAGE WHAT SO EVER...

Use NOTHING. Everyone will hear an airplane at 30K ft out 250 miles. No need to hit any digi

But by using WIDE, you will go an additional 20 miles beyond the 250 mile range Line of sight (big deal). But you will penetrate some basements you wouldnt otherwise hit. ANd one WIDE will never loop. so its OK

You could do just GATE and all VHFers with an outside antenna would see you out 250 miles at 30K feet PLUS all of the HFers would see you. *BUT* MANY GATES will hear you and they will ALL collide on HF at the same time, so this is NOT a good idea either....

DO *NOT* do WIDE,GATE.   THe GATEs will hear that packet TWICE and you will be QRMing the HF net by 400% due to the many gates times TWO..

So it looks to me like the only answer is WIDE only...

Thanks for the reminder, Bob. I'll go back and read the documents
again. That sounds like exactly what we need to handle the interference
problem.

>3)  What happens if you BUDLIST out WIDE?  I think the filters in the
>TNC's only BUDLIST the FROM and TO calls, and you cant filter out the
>DIGI path?

   I thought of that. Well, almost... I suggested to the DEC that as
a last resort we might remove the WIDE from the digi about six hours
before a storm makes local landfall. Unfortunately that would still
allow distant stations to put data on the individual displays,
although they would no longer be able to disrupt the entire net.
   One of the reasons that I am doing this task is, I am the
farthest inland station (60 miles) on the local net. Consequently
I should still have reliable communications when the heart of the
storm hits the coast. Unfortunately, this makes me more susceptable
to interference from inland distant stations, that are unconcerned
about the accuracy of their data.
   It still might come down to that, but I think the SPECIAL and
ALTNET modes will do the job.

It's too late to try it for Cesar, but the next TD is fair game. I'll
```

let you know how it works out.

regards,
Joe

Sure is Jim, just go into the filter menu and turn on the GATE
filter..this prevents posting of any station with GATE in their path
much in the same way as the BUDLIST in your TNC prevents connects to
stations you don't want to hear from.

How 'bout just the letters "APRS" and then what it stands for: "Automatic
Position Reporting System"?

Then nobody has to fight over GPS, WX, maps, mac, win, dos, etc applications.

Joe i respect what you and the group are trying to do, BUT you keep saying
that other user information is not accurate "inland distant stations, that
are unconcerned about the accuracy" I beg to differ with you and take
offence to your remarks. During betha i downloaded the information directly
from NOAA as it came in and no more then 2 minutes later posted it on APRS.
You cannot expect the whole APRS network to stop because you think they
should. Believe me you'r going to run into these problems, i can tell you
this first hand because i did also. But please don't refer to other users
of APRS that have been using it for many years as INTERFERENCE and that they
are UNCONCERNED about ACCURACY. I surely hope the people in your area have
more precise and accurate equipment to predict heavy weather then APRS,
although i agree it can be very helpfull to local ARES and RACES groups.

I'd be careful here! Bob, wouldn't the ALT-net be more like a PRIVATE net
and not allow anyone monitoring the net see it? I can understand using
that for certain situations, but in this case, it would be best for all to
be able to monitor it.

Please clarify this.........

If the digi is picking up the generic WIDE, would it not send that out and

828. APRS Perseids Meteor Scatter Test

From: stanzepa@usa.nai.net (stan horzepa)
Date: Mon, 29 Jul 1996 10:45:43 -0400
To: aprssig@tapr.org
Message-ID: <v01540b00ae227e5a8772@[206.98.48.249]>
Rendered body type: text/plain

APRS Perseids Meteor Scatter Test Announcement

Date and Time: August 11 0000 UTC to August 12 1200 UTC
(August 10 2000 EDST to August 12 0800 EDST)

Frequency: 145.79 and 50.62 MHz (if available in your area)

Mode   1200 baud AX.25 packet

All amateurs are encouraged to participate in the Perseids meteor scatter test August 11-12. Although 6 meters is better than 2 meters for meteor scatter work, everyone has a 2-meter radio and we can make up in numbers what we lack in performance (during the 1995 test, numerous stations received packets from 600 to 1000 miles away and a handful even copied stations over 1000 miles away... on 2 meters). All you need is a TNC and, preferably, high power and a beam. The objective is to see how many grid square (DX) packets you can receive over the 36-hour event (a successful connection would be icing on the cake).

Stations in the four quadrants of the continent transmit alternately for 15 seconds (the quadrants are formed by the 39 degree north latitude and 96 degrees west longitude). There are two ways to do this: (1) by using the Meteor Scatter (MS) mode built into the DOS version of APRS or (2) by placing your six-digit grid square in the Unproto To call sign field, for example, WA1LOU>FN31MP.

Suggested procedures for the test follow:

1) Point your beam towards a major population area 500 to 1000 miles away in one of the other US quadrants. If there is another active local station, coordinate your beam headings so you are not both hitting the same azimuth and receiver target area.

2) Enter your grid square into your TNC using the following command:

```
cmd: UNPROTO FN31mp
```

where FN31mp is your six-digit grid square. If you can't estimate the last two digits, use aa. Note that no Via Digipeater is used.

3) For attended operation, enter the Converse Mode (cmd: CONV). Each time you hit carriage return <CR>, you send a packet. Hit 20 <CR>s and you send 20 grid square packets. Synchronize your clock with WWV and transmit as many packets that you can according to the following schedule:

Northeast stations transmit between 00 to 14 seconds of each minute.

Southeast stations transmit between 15 to 29 seconds of each minute.

Southwest stations transmit between 30 to 44 seconds of each minute.

Northwest stations transmit between 45 to 59 seconds of each minute

4) Alternatively, run APRS DOS version 7.1b or later. Its automated meteor scatter mode plots received packets on a map. (Read the file METEOR.TXT bundled with the latest releases of APRS.)

By the way, only stations running at least 100 watts into a beam antenna should transmit. Anything less is unlikely to propagate packets via meteor scatter and just causes unnecessary QRM. For example, during last year's test, I transmitted 150 watts into an 11-element beam and nobody reported receiving my packets!

Even if your station is not a powerhouse, you can still participate by monitoring the test. If you are running APRS, each received grid square packet is plotted on a map and entered into the APRS Heard log.

If you are not running APRS, set the clock in your TNC and enabling the time-stamping function so that each monitored packet displays the date and time of its reception. This makes logging received packets easy and permits unattended monitoring and logging when you are unable to sit in front of your computer. Watch for stations sending packets containing grid squares. Make a note of the grid squares that are 500 to 1200 miles from your QTH. When you receive a grid square from one of those, you know you have hit pay dirt. If you are running 100 watts or more into a beam antenna, you can try and make a connection with that station, too!

After the test, I will need your reports to see how we did. Your reports should contain the following information:

Your call sign

Your state/province

Your grid square

Your effective radiated power

Call signs of received/connected stations

Grid squares of received/connected stations

Time of reception/connection in UTC and number of received packets

Distance between you and the received/connected stations

Send your reports by email to:

stanzepa@nai.net

Or by mail to:

Stan Horzepa, WA1LOU
One Glen Ave.
Wolcott, CT 06716-1442

Have fun!

> be able to monitor it.

APRSdos REPLY COMMENT: True, altNET is "private" BUT everyone can see it
by just setting CONTROLS to OTHER.  In this case, someone should beacon a
bulletin saying "To see severe WX net, set CONTROLS-OTHER..." I agree that
this is not optimum.  I would think that SPECIAL is the way to go then
everyone else AUTOMATICALLY sees it.

One other thing, remember that you can set WX-JUST under the WX menu so
that ONLY WX stuff is displayed.  This is a toggle setting as opposed to
the normal JUST-WX command which is a one-time display...

Rendered body type: text/plain

```
There is a good message on here about the "expirences" of APRSnet during
Bertha that identified a few bugs. It was well written and very
informative to us "land lovers" here in tornado alley. In the message the
problem of "outside the net" reports was identified. Mainly due to the
good conditions during these storms, does this happen.

Out here in the "sticks" we welcome all input that we can get, be it one
or two miles off course or not. In addition to our local net, we receive
(when conditions are good) reports from other areas, which often effect
our situation on down the line.

Bob, may I suggest this in an upgrade. That an additional mode, called
LocalNet (or whatever) be added that DOES see the "outside" stations but
DOES NOT plot them without operator ok or unless x amount of Heards. A
sort of delayed-DX mode. This mode should give the operator the option to
"flag" out-of-net position reports on or off. Instead of out-of-net it
could rather be out-of-x amount of mile range.

Just a thought.......any comments?

Both Marden and International Crystal can make these reliably.  Further, with
the appropiate data from the serial plate (something like U43MLT) you will
give them all the info needed to make the crystal and get it cut correctly.

International's phone number is 1-800-call-icm

Marden's got an 800 number, but I cannot recall what it is, and all my Parden
data are at home... and I'm not!

Hope this helps.  73,

I use the (M)ap (S)ave 3,5,7 or 9, to eliminate the need
to resize the maps.

By the way Bob, The docs say that 1 is supposed to be the
USA map, by default. I find that it is actually the
Marathon display and I can't save any other map to that
number. This forces me to waste another number on the USA
map. How do I get it to save the USA map to 1?

Jan's Crystals in Florida. They have a 1 800 number but I don't! Sorry.
You can find it listed in any ham mag. They got me crystals send out in
two days after the order. All you need to tell them is the freq and radio
type and they'll do the rest!

Dale,

Everything works perfect here through Netscape 2.01 32 bit Windows95.
I found that a couple of times the map loaded in but no data, all I
did was hit reload and all was well, my guess is that the server was
near it's 30 users limit or I stepped in at an inconvenient time for
the server.

Excellent work! Thanks

Subject: Re: [APRSSIG:3430] Re: Info on Crystals
Cc: jaym1@soho.ios.com

Beware of Jan Crystals for a digi or repeater... especially their 2 day
non-aged ones.
Stick with a manufacturer like International, not an el-cheapo!
We sent back over a dozen crystals to Jan because they were drift-o-matics.
Along with them, we sent a good International crystal.  Instructions were to
not send the crystals back until they were of equal quality.

I stopped by Jan Crystals when I was in Ft Myers  on my infamous Florida
trip this past Winter... they refused to allow me to see their manufacturing
process and quality control facility. No tour, no pictures, not even a glass
window.

BTW-  about the returned crystals... They never even offered to remake them
or refund the money!

Bomar is ~~ok~~, but still not great.  About half of the ones I get from
them are off freq, drift, or have low activity.

In an earlier message, Scott Ratchford recommended:

    But I don`t exit, this station runs 24 hours...except when the
floppy fills up and I get Dos erra #61 . But at least the digi keeps
on digie`ing ha ha. Actualy I just pull the disk and delete the log
and hst files, replace disk and hit enter and it (APRS) keeps on
running. Perhaps I will delete the config file and try
again? I only have room for 3 maps...I`ll have to delete 2 of them so
my PCjr will run through a whole weekend without crashing.

That's odd for antennas to break like that.  I've never lost an antenna, even
when a BIRD hit it.  (But then, I use permanant mount antennas.)

If that's an ongoing problem for you, may I suggest that you get a Larsen
NMO-MM base (mag mount), and an NMO-Q quarter wave whip?  I had one of those
things, and nothing would remove it.  (Well, a kid with a pair of wire cutters
eventually did...)

Another comamnd that may come in handy is the GATE Filter. If you are
bothered by the "DX" from a GATEWAY in the area or a GATE coming in during
morning or evening skip from another area nearby turn on the GATE filter as
we have done during the metor tests.  This will keep the screen clear of all
that traffic.

THey were far from the best in their time but for the price of crystals I
would say it is worth it.

As far as crystals any of the crystal companies can help you out, you MUST
have the EXACT model number and just tell them TX 145.79 and RX 145.79. BTW
MOXY is not the model number, this will be a long series of letters and
numbers that actually tell you the frequency span (probably modified if
already in ham use) power output, year made, and number of channels it is
capable of.

International Crystal is the best company out there but expensive. Bomar
Crystals in Middlesex NJ is another less expensive one and so is Frequency
Managemant in CA. I have ordered crystals from all of them in the past and
would probably go with Frequency Management or International. Whatever you
do stay away from JAN Crystals!

Remember Crystals must age properly if not you will have problems in the future. Fast is great but too fast is a bad sign. I have tried Jan in the past and all I have had is problems usually 3 or so years later if not as soon as they had arrived. Never had one crystal from them be 100%.

855. DFjr Test Results

From: melliott@ocslink.com
Date: Mon, 29 Jul 1996 18:59:11 -0500
To: aprssig@tapr.org
Message-ID: <199607292359.SAA32467@ocslink.com>
Rendered body type: text/plain

Hello Joe

I know it has been a long time since you heard anything from me, and I know that you are probably still swamped with a long list of E-mails from everyone. Therefore, I will make this report very brief.

Mark/N9WST, and myself were finally able to get together and try our DFjrs out. The semi-controlled tests were under real conditions, and only on VHF (two meters). After calibrating my unit, I set out to "hide" from Mark. When he located my position, he would go "hide" for me.

With the unit in the statistical mode and left at the default sampling rate, my DFjr seemed to work exceptionally well. Mark hid in some pretty challenging locations, and yet, the DFjr led me right to him each and every time without fail.

Reflections? ... what reflections? I did not notice any real problem with reflections, but I know they were there. Occasionally, I could hear the distorted/tinny sound, and perhaps an off-beat LED indication every now and then, but one just needs to keep in motion. We also transmitted multiple DTMF tones in an attempt to throw the DFjr off course ... nothing doing.

I have noticed that you really need to keep a close eye on the display while it is in this mode. As the sampling rate does not update like I am used to, and before I knew it, I had already passed the transmitter location. (I am used to using a homebrew DoppleScAnt, which is always in the "raw" mode).

Mark and I still intend to do some testing, perhaps on 220 and 440 and above. I have a few ideas to try out, and the only good way to try to complete all of the various testing, is to just be able to get out and do it. I will keep you aware of our progress.

I do have one suggestion to improve the DFjr. That is to add an ON/OFF switch to the unit. This would really make the unit more user friendly.

73,
Mark/WB9NKP

>Joe i respect what you and the group are trying to do, BUT you keep
>saying
>that other user information is not accurate "inland distant stations,
>that
>are unconcerned about the accuracy" I beg to differ with you and take
>offence to your remarks.

I am sorry, Bill, that you have taken this personally.

I deliberately refrained from publicly identifying any
station that posted bad or obsolete data. Instead, I
attempted to contact those operators, privately, and
provided assistance with path recomendations, math
conversions and urls for the Marine Forecast Advisories,
to use instead of the Public Advisories. I wish someone
had done the same for me, when I first started out,
rather than just ignoring my mistakes and letting me find
them out the hard way.

I believe that these same mistakes will continue to
happen, as every storm will bring out new stations,
trying out the techniques, so this will continue to be an
ongoing problem.

The simple fact that I did mention your station, as a
source for one solution, should reassure you that I was
not attempting to infer that your data was erroneous. I
do pick up your packets, intermittently, and your
postings are always square on the track of my own storm.

If the time comes that one of your postings is off to the
side of my own track, I will disable my transmitter and
take the time to check my own data, before doing anything
else.

If your station came in 80% of the time instead of
intermittently in the evenings and early mornings, I
would not be doing this task in the first place. Instead,
I would work to figure out a way to digi your packets
into our local net, all the time.

regards,
Joe

I took a look at the server last night (very late!). After the long load I was
impressed with the map and I saw monitored packets on the bottom of the screen
but no positions were shown on the map! I then tried switching to the SE US map
and got the map but no more data...

Tried to access late this afternoon and got a fatal error in Netscape Navigator.
I'm wondering if the newer version has a bug....

Nonetheless, I'm looking forward to playing with this more and we may even be
interested in doing the same thing here in Kansas City in the near future! I
have access to a full-time server at school and I could easily get space....
The location of my school (extreme NW MO, 20 miles S of Clarinda IA would make
the entire IA/MO/KS APRS Network accessible by Internet!!!

I've been hearing DX stations in the morning. I usually hear them through a
local WIDE as denoted by the * next to it in the station's string. But, how
do I tell which local WIDE I'm receiving? Also, shouldn't my unproto be set
to wide,gate,wide to reply? It is and I haven't been able to reach those DX
stations.. What am I doing wrong? Thanks in advance for any help.

(Phone: 208/387-5634)

RELEASE: 96-151

AGENCIES TEAM UP TO IMPROVE AERIAL FIREFIGHTING

In an effort to improve aerial firefighting safety and efficiency, NASA, the Bureau of Land Management, the USDA Forest Service and the Nevada Division of Forestry are cooperating to examine and evaluate aerial firefighting communications and the airspace structures over wildland fires.

The agencies also are evaluating an electronic Advanced Navigation Display System (ANDS), developed by NASA's Ames Research Center, Mountain View, CA, to aid aerial firefighters in their communications and operations.

"This project potentially will help aerial commanders direct their assault on a wildland fire by simplifying, standardizing and reducing their verbal communications," said Ames' Vernol Battiste, the project's principal investigator and a former air traffic controller. "Loss of situational awareness by pilots in high workload situations often has disastrous consequences," he said.

"Our research will assist firefighting agencies nationwide in identifying solutions that should reduce the cost of extinguishing fires and improve safety during aerial firefighting operations," added Battiste.

During the project's first phase, scheduled to begin in early August, in-cockpit, air-to-air, and air-to-ground communications will be recorded and pilot workload information will be collected.

"This will be accomplished through use of mini-cameras installed in the cockpits of the aircraft, as well as through a post-flight questionnaire to be completed by the pilot and crew," said Hugh Carson, the Bureau of Land Management's Nevada aviation manager and project leader.

Five firefighting aircraft based near Reno, NV, will be used during the data-gathering phase of the project. Participating aircraft include an OV-10 lead plane, a Commander 500 air attack aircraft, two P2V airtankers contracted from Neptune, Inc., Missoula, MT, and a Bell 204 helicopter from Idaho Helicopters. Along with audio-video recording capability, the prototype ANDS electronic display system also will be installed in each aircraft.

The ANDS system shows the position of other firefighting aircraft, establishes an airspace structure graphically on the computer screen, identifies areas needing retardant or water drops and transmits those images to other aircraft.

NASA researchers also will be testing integration of Forward-Looking Infrared technology with the navigation display. Participating companies that have loaned equipment to the project include Baker Electronics of Sarasota, FL, Landmark Technologies of San Jose, CA, Inframetrics of North Billerica, MA, and Dynametrics, Inc., of Las Vegas.

The ANDS system uses Pentium-class computers, graphics displays utilizing CD-ROM moving maps, radio modems, and Global Positioning System signals to show each aircraft's position and provide two-way data communications between aircraft.

Carson said the display's success will be highly dependent upon whether it can assist the pilot or air tactical supervisor in his or her tasks. "It must be a human-aiding tool," Carson said. "This aspect of the project will be totally driven by user feedback. It has the potential to significantly reduce the need for verbal communications. However, if the pilots and air tactical supervisors don't like it or use it, it's not going to end up in our airplanes."

Battiste said the human-machine interface of the ANDS system, and the challenges it presents in a high workload situation such as aerial firefighting, is a critical part of this study.

According to Lanny Allmaras, national aerial attack systems specialist for the Forest Service at the National Interagency Fire Center, Boise, ID, the basic objective during this first phase of the project is to gather information about what actually goes on in and outside the cockpit of an aircraft during aerial firefighting operations.

"Communications issues are frequently brought up at many post-fire reviews, as well as at aerial firefighter meetings," Allmaras said. "Whether or not the hardware technology can assist us in doing a better job remains to be seen, but we welcome an outside look by NASA, a proven world leader in aeronautics, communications and human factors research."

Under an interagency agreement signed last fall, the Bureau of Land Management and Forest Service are responsible for providing NASA with sufficient data to accomplish its research. Tests and data collection during actual firefighting missions are expected to continue into the 1997 fire season.

NASA will then make recommendations back to the fire agencies concerning communications, airspace structure, training and the display system. The fire agencies will examine these recommendations, consider available funding, and decide on implementing the proposal.

NOTE TO EDITORS: To arrange on-site interviews with the aerial firefighters, contact Cheryl Davis, Sierra Front Coordinator, Reno, NV, at 702/883-5995; or 702/721-3377.

-end-

NASA press releases and other information are available automatically by sending an Internet electronic mail message to domo@hq.nasa.gov. In the body of the message (not the subject line) users should type the words "subscribe press-release" (no quotes). The system will reply with a confirmation via E-mail of each subscription. A second automatic message will include additional information on the service. NASA releases also are available via CompuServe using the command GO NASA.

Hi guys. What happens when you leave the switch in the 12V position then
hook up to a 24V aircraft?

SMOKE!

Sorry. The KPC-3 is rated for 28V but the Motorola Encore and Allinco
DR1200 are not. Have to tear into them and see how much damage my STUPID
ATTACK did.

Dave
Mojave N9232Y
WB0WNX-7

P.S. If all goes well I'll be traveling to Oklahoma City and back as well
as St. Joe, MO next week. I'll keep you advised.

P.P.S. Even though there is NO APRS activity in the Sioux City area other
than me, once I climbed through 6,000 ft (5,000 above the ground) the
frequency was constantly busy. One day, when someone else is flying, I'll
hook a computer up and see what I can hear!

I just read Stan's epistle on how to work the Meteor Shower and that you
should run at least 100 watts and use a whoppum beam and I have a question
as to the validity of a signal being received.

I am the sysop of a BBS and look at nodes tables as they fly by on the
screen and many times during the evening I will see NODES showing up in the
tables that are hundreds of miles away, the ONLY way that could have
happened is if the broadcast from the original node was reflected off of an
aircraft flying up in the Wild Blue Yonder.

So, with aircraft flying up around 40,000 feet, how can you tell by
watching your screen that it was a meteor reflection and not from a passing
aircraft? Running 100 watts plus with a high gain beam, I am quite sure
you will be bouncing your signal off of many aircraft!

APRSdos REPLY COMMENT: This is an important point for Balloons and
Aircraft.  Your receiver wiill hear so much activity on 145.79 that it
might not EVER hear the channel go clear, and therefore may not ever
transmit!  If your flight is important, you might consider setting the TNC
to full duplex so that it will transmit without regard to channel busy...

I say this with anxiety, becasue this is a feature not to be abused! hi hi

This is how SAREX operates.  Otherwise, we would never hear anything...
I just calculated that as soon as the flight is line-of-sight to about 60
stations, averaging 4 digi hops each, then you will hear 100% channel
saturation, and the flight will never hear a quiet period!  Here in
Annapolis, on the ground, I routinely see the full 80 capacity of APRS all
the time!

Hi, Bob...

Using APRS 7.5F.

Did the Alt-S, Format, for beam direction I put 000, power 025 and selected
the defaults for the rest.

At the first transmit, got error msg in 2nd line of upper left corner of
map. (map had the blue grid squares like SPACE mode)
```

```
Any other specific I should test for? OH... set the Unproto to NONE

>de wb4apr@amsat.org

Bob... I apologize... trying to be multi-modal and failing (rapidly)...

The error msg said to CHECK YOUR APRS SUBDIRECTORIES

The Grid square identifier displays as for the space mode. Until I
regenerate the screen, that is. Then it is gone and the grid squares are too.

When it does a meteor transmit, in view mode I see:

cmd:cmd:

And nothing in the View mode when I kick off any other type (ALL)

Hope this helps a bit. I never tried this before so I really don't feel that
I know what it is I think I see on the screen. The TNC seems to kick off
when APRS beeps.

Give me something specific to try, perhaps. That may be more fruitful.

Rendered body type: text/plain

```
I just saw a new digi last night in western Virginia.  It is KB4CNI-3
which has been moved to 4400 feet on Elliott Knob.  It has been on the air
before, but its height above average trerrain has gone up from 80 to over
2500 feet..  Currently the next digi north, WA4TFZ, is off the air due to
local interferrence to/with its colocated voice repreater...  So I was
lucky to see it.  If you do a MAP-PLOTS-POWER you will notice that it
favors to the north.

I've had good luck with both International as a first choice and Marden as a
2nd choice for both quick-ship (2 weeks) and aged/compensated crystals for
repeater and mobile work.

We've had problems with Bomar too... ordered 223.34 xtal and somehow they
sent a 224.94 xtal.  How they managed to send us the xtal for the output
of our 220 repeater instead of the input I'll never know.

Have a friend who lives in Ft. Myers who sounds like he's getting in good
with Jan (he has tons of repeaters and builds and sells them too) and I'm
he seems to be using more Jan xtals of late for whatever reason.

Yes, International is one of the best and Frequency International is not bad
either. It is no International but at about $12.50 per crystal they are not
too expensive. Frequency International is a division of Standard
Communications Commercial Division or a part of Standard that just recently
broke off on their own.

Alan,

I don't think that Del, KD1DU is on the list.  However, his QTH is the envy of
VHF operators, being on top of a ridge with his antenna on a tower that peaks
well over 1000 ft ASL.  He lives in Ridgefield, CT, which borders NYS.  He
selected that house about a year and a half ago, based on its RF ability.  That
probably explains why you heard him.  Perhaps that, plus we have had some
dramatic tropo openings in the last couple of days, mornings and evenings.

Del is setting up a WIDE digi to assist some stations in SW Connecticut
that can't otherwise get into the net due to topography and distance to
other WIDEs.

In case you saw the question I posed the other day about being able to
monitor and plot only stations heard directly, it was for Del's benefit,
since he is a big-time VHF/UHF/microwave user.

DOS maps will work with WinAPRS but the maps made for WinAPRS can have more detail and a size limited only my the size of the computer (so I'm lead to belive!).

APRSdos REPLY COMMENT: It is called the APRS MIC-ENcoder.  We have a few
dozen prototype kits available.  If you have a recent version of APRS,
read the VOX-APRS.TXT file or VOX-RPTR.TXT file...  They are $95 and are
available from Clement Engineering 410-268-6736.

APRSdos REPLY COMMENT: DOS maps can have any detail even to the tables
within the HARA arena in Dayton.  The difference is that WinAPRS maps can
have a much larger number of points in them without having to change
maps.

3. NMEA=>LCD display with stamp BS2

From: Bernard Seront <seront@seism1.ess.sunysb.edu>
Date: Thu, 01 Aug 1996 16:30:45 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960801203045.0067cfd8@seism1.ess.sunysb.edu>
Rendered body type: text/plain

```
A few people asked for the code, so here it is (at the end of this message).

It's very basic, and can certainly be improved. One think to do is to add a
switch to scroll between two or more displays (lat/long then speed/direction
then time ....).

Major problem with the stamps is the RAM limited to 28 bytes: you just
cannot read more than (for example) lat, long and time in one operation.
That makes for a quite slow refreshing rate if you want to display 5 or 6
parameters

A better way to do the job would be to use directly the PIC microcontroller
(16C57, cost <10$) found in the stamp, programmed in assembly language.

Bernard, KB2TGH.

-----------------------------------------------------------------------------
' Display latitude and longitude out of a GPS (NMEA output) on a 16*2 lines
LCD display using the hitachi HD 44780 controller. Needs the stamp BS2 for
4800 bauds NMEA. The LCD is wired in 4 bits mode according to the
application note #1 in the stamp 1 manual. The code for LCD is adapted to
the BS2 from the same app note. The NMEA input is on PIN 7.
```

```
lat var byte(8)         'latitude without last decimal

4. Maps for WinAPRS

From: elmartin@iamerica.net (Eric L. Martin)
Date: Thu, 01 Aug 1996 21:43:19 -0600
To: aprssig@tapr.org
Message-ID: <199608020244.VAA26541@ns2.iamerica.net>
Rendered body type: text/plain

I'm looking at purchasing a new laptop that I would like to use on
my trip to the DCC this September. I am going to be running WinAPRS mobile
on Amtrak. I am aware of several mapping programs (ie. Street Atlas USA by
Delorme), and I am wondering if any of these maps can be used in WinAPRS (or
APRSDos also) from the CD. Also, if the maps can't be used, is there any
certain programs that stick out above the rest for details, as I would still
like to have a good mapping program for regular use? TNX

5. APRS data over internet

From: "Bruce W. Martin" <martinbw@telalink.net>
Date: Fri, 2 Aug 1996 11:27:06 -0500
To: aprssig@tapr.org, Steve Dimse <sdimse@bridge.net>
Message-ID: <9608021127.AA06922@oscar.telalink.net>
Rendered body type: text/plain

I just used the TGE TCP Communications Toolbox tool on my Mac to connectthe
APRS telnet port(www.wa4dsy.radio.org:14579 or 206.28.196.150:14579) to my HF
TNC port on MacAPRS. Very cool. The data from Atlanta came in (normally see
alot of Atlanta stations anyway here in Nashville) and displayed on the map
just fine. A few questions/statements.

1. I assume the telnet site ignores anthing sent from the sites logging in.

2. How can I set up something like this in Nashville?

3. Assuming other folks find this interesting enough, is it possible to take
the data from several cities and consolidate it to a single telnet port
(kindof like a one way HF gateway)?

4. Am I the only one that thinks this is an interesting spin on APRS?

73

Bruce

7. Maps for APRS

From: Mel Muecke <MMuecke@InterfaceTech.com>
Date: Fri, 02 Aug 1996 11:26:13

Message-ID: <19960802112613.388d89ee.in@InterfaceTech.com>
Rendered body type: text/plain

I too am interested in mapping sources. Does anyone know the differences
between Street Atlas USa (Delorme?) and Precision Mapping 2.0?

I have noticed that Street Atlas has lots of little errors at the street level.

Which one would be better for use in generating maps for APRS?

thanks,

Mel

Yes, But this may change in th future.

>
>2. How can I set up something like this in Nashville?

The current server is C++ code for OS/2. As soon as I get all the
bugs worked out I'll make it available in source form. This was
a "quick and dirty" project so portablilty was not considered.
Others are welcome build versions for their favorite OS. It's
really not very complex.

You will also need a fixed IP address and domain name on a machine
with 24hr internet access.

>
>3. Assuming other folks find this interesting enough, is it possible to take
>the data from several cities and consolidate it to a single telnet port
>(kindof like a one way HF gateway)?

Sure.... as soon as we work out a protocol for inter-server communications.
This could be as simple as the server resending everything it hears
from the telnet port to everyone logged on except the sender. A time-to-live
field will probablily be required to prevent infinite loops.

>
>4. Am I the only one that thinks this is an interesting spin on APRS?

I hope not ;-)

>
> How can I set up something like this in Nashville?

APRSdos REPLY COMMENT: I have a program running on a DOS machine that
listens to a TNC, and ships 4 files over to my WEB page server. These
files contain: APRS ALL (all stations heard)
                     APRS live (Last 2 hours worth)
                     HF   (all HF packets)
                     BOATS   (all Naval Academy boats)

These files are updated every 10 minutes (could be every few seconds, tho
I dont see the neeed)

When you access my APRS WEB page, then you dont have to wait for 10
minutes to see what is happening, you get a full map of everything all
the way up to the current minute (or so)..

This uses Steve Dimse's java application to display...

It has been working locally for 2 days and yet, we still are having problems with remote WWW access. That should be solved in a few hours more... I will post the web site then...

10. javAPRS Update

From: Steve Dimse <sdimse@bridge.net>
Date: Fri, 2 Aug 96 15:52:42 -0400
To: <aprssig@tapr.org>
Message-ID: <199608021949.PAA00499@bridge.net>
Rendered body type: text/plain

Thanks to all for all the kind words about javAPRS. The development is continuing, although I am spending much of my time working an an internet server. There is a new update available on the tapr ftp server, as well as on WA4DSY's http server.

The biggest new feature in the ability to use control-click to center a map, and alt (option on the mac)-click to center and zoom.

Also, you can now click on a station and see data displayed. Lat/lon is now in degrees, minutes.hundreths, instead of decimal degrees.

For those of you who haven't looked, here are the urls:

Live Atlanta data-
http://www.wa4dsy.radio.org/aprs

Canned demos-
http://www.bridge.net/~sdimse/javAPRS.html

tapr file-
ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload/javaprs.zip

(Using this requires the Java Development kit from Sun, or some other Java environment, be installed on the host computer.

Or you can use the PBASIC Compiler to port your large BASIC Stamp programs over to PIC machine language.

```
Introducing the PBASIC Compiler.

A Product by MicroEngineering Labs. of Colorado Springs CO US.

The PBASIC Compiler takes programs written for the BASIC Stamp 1 and
converts them into PIC compatible hex or binary files. These files can
be programmed directly into a PIC microcontroller eliminating the need
for a BASIC Stamp module. The easy-to-use BASIC language makes the PIC
programming available to everyone with its English-like instruction
set.

In addition to the hex or binary file output, the PBASIC Compiler also
generates an intermediate assembler file. This source code file may be
edited and re-assembled using the included PIC Macro Assembler (below)
to allow additional operations or access to other PIC registers.

While primarily intended for use with the electrically erasable
PIC16C84, other PICs with more memory or larger pin counts may be
substituted. The use of PICs other than the 16C84 allows for lower
cost, longer programs, and access to more I/O or RAM through the use
of assembler programming

     Easy to use English-like BASIC language.
     BASIC Stamp 1 compatible instruction set.
     Faster program execution than BASIC interpreters.
     Longer programs possible.
     Substantial cost savings over BASIC Stamp.
     Works with most PIC programmers.

Their web page is at http://www.labyrinth.net.au/~donmck/more.html

Yes, looks like a very nice product to fill the gap between the stamp and
the PIC microcontrollers. It costs 99.95$. You need a programmer for the PIC
thought  (<50$ in kit), but if you plan to build more than one circuit
that's cost effective.

Beware that it only supports stamp1 code, and there is (as far as I know) no
planned move towards stamp2 code support. That means  that you have to trick
with the frequency (speed of the controller) to get 4800 bauds serial
communication.

Still another option is to use the parallax (company that makes the stamps)
PIC programmer (100$). With this one (and only this one) you can program a
16C58 with your basic code! What the programmer does is to program the chip
with the basic interpreter core at the same time. Supports only stamp1 code,
and is still interpreted at the execution, i.e. slower than the compiler.

FYI: in CQ DL, June 96 (German ham magazine) DF9IC presents a packet modem
based on a PIC microcontroller. Don't ask me for details, I got the
information second hand.

Anyone knows which microcontroller is used in the MIM?

Bernard, KB2TGH.

APRSdos REPLY COMMENT:  That is the "NEXT STATION" and PREVIOUS STATION
commands.  Notice that the upper case version of those keys are the
Keys < and > which cycle through the next or previous station on the "current"
map scale.  This is in contrast to the + and - keys which cycle throught
the NEXT and PREVIOUS station in the "system".  These < and > keys are
very handy for zooming into an area, and then rapidly cycling through
everyone in that area.

NOTE:  Since APRSdos avoids two-handed operation where possible, then the
lower case version of the same key will do the same thing.  Therefore
, means PREVIOIUS and . means NEXT.  Hope this helps... hi hi

JM> agreed.
JM> His radio is a Motorola MOXY (he says). Does anyone know of:

JM> 1. A source for transmit and receive crystals for this type of radio.

Radio Shack scanner xtals work fine for RX, and are cheaper than most other sources. TX xtals are available from Marden, 1-800-222-6093, or JAN, 1-800-JAN-XTAL. Expect to pay $13-$15 each. Add $5-15 each for faster service.

JM> 2. Any special tech requirements for these crystals.

The xtal mfrs. have all the specs.

I am running a 25-watt Maxar, which is basically the same radio, on TCP/IP, and have a 60-watt Moxy in the car on the local repeater. Very decent rockbound radios.......

>
> W2RS assembled statistics about amateur satellite operators. There seem to
> be about 18000 satellite operators world-wide; 25% of these have some sort
> of digital capability...

APRSdos REPLY COMMENT: 1) Looks like there is some movement away from the
145.800 which if you remember was causing concern for its proximity to
APRS operations. 2) Lets see, that means there are 4000 digital capable
amsat operators... I just went back and looked at my APRS SAREX report
for STS78 and noticed that I estimated between 2200 and 4400. (Only 37
of these were APRS stations...)

I still think there is a great application for APRS in the amateur space
program. But I dont feel comfortable about being the primary "PUSHER"...
So when,where you see opportunities, put in a word for APRS...

Heck last time I was up there the Washington/Woodbridge VA area along I-95
had very little coverage if at all, more like at noise level. With the
number of hams in that area you would think they can talk HRO in Woodbridge
to sponsor a digi or at least help. Any plans to expand in that area and
make it solid into Baltimore along 95 ?

Rendered body type: text/plain

```
There will be a balloon launch on August 10 from the Wharton Airport (about
50 miles south-west of Houston). It will be carrying a transmitter sending
NEMA GPS data compatible with APRS.

The coordinates of Wharton are roughly 29 deg 16' N, 96 deg 6 min W.

Are there Mac/Win 100K maps available for that area? Depending on winds
(expected to be light) it would be best the have three quadrangles just
west, south-west and south of the Houston quadrangle.

Lacking the Mac/Win maps, is there a detailed DOS APRS map of the area?
```

Sorry Ron can't help you with the maps since i don't have the CD to cover that
area. What is the planned time of the launch, and also the alternate day if
any. Also the frequency if not 145.790. Thanks will be watching for it, and
will be pointing my stacket 13B2's that way.

I would like to know how I find out in APRS (either DOS or WIN) what path a
distant station's beacon took in reaching me. More specifically, I would
like to find which local gate is relaying HF signals on the local 2m freq,,
so I can set up my unproto correctly. Thanks in advance for any help.

```
Last Wednesday, Roy wrote:

>can anyone tell me how to make a map for WinAPRS without using a Mac??

No way that I know of, other than making DOS maps and translating them.
Something that could be useful to know is that MacAPRS has the ability to
combine maps. That way, you could possibly create multiple DOS maps and then
glue them together. But I don't know if that feature was ported to WinAPRS,
and, if it was, whether there is the ability to merge translated DOS maps as
opposed to original Mac/Win maps from DCW (Digital Chart of the World) or 100K
(USGS Digital Line Graphs) sources.

Also - and this is not really an announcement; more like a strong hint - I'm
about to add insult to your injury with "MacDLG", a new map generation program.
The first version is in final configuration and testing, and I expect to
release it within the next two or three weeks. It generates both Mac/Win and
DOS APRS maps from 100K DLG and Census Bureau TIGER data. A neat feature is
that it optimizes the line data, resulting in maps with file sizes 35%-40%
smaller than the current crop of 100K maps. I'll be uploading a couple of maps
to the FTP server in a day or two.

I have no plans to produce a Windows version of MacDLG - unless somebody wants
to make me comfortably wealthy to do so. ;-)

And then on Friday, Mel said:

>I too am interested in mapping sources.  Does anyone know the differences
>between Street Atlas USa (Delorme?) and Precision Mapping 2.0?
>
>I have noticed that Street Atlas has lots of little errors at the street
>level.
>
>Which one would be better for use in generating maps for APRS?

Neither. The file formats are proprietary and can't be translated, and if
```

somebody did, there'd be Hell to pay in the form of lawsuits. Commercial mapping companies are intensely protective of their data. Map companies are notorious for "spiking" map data - deliberate misspellings, added nonexistant items like the minor residential street that really isn't there - that are used to prove that somebody copied their map.

Practically speaking, there's been some discussion about the eventual ability to use bitmapped screen snapshots in Win/MacAPRS, but this is still on the "to do" list. Then there's the limitations of bitmaps to consider, such as scalability, and information content vs. storage size vs. program overhead in image handling.

Street Atlas USA is based on the Census Bureau's TIGER mapping database, and the errors you note originate from that. I've been finding things wrong in TIGER that were just fine in the USGS 100K database, which was where most of the TIGER cartography was supposed to have come from, while TIGER has important things updated that aren't in the 100K files. Go figure!

Anyway, this is why there is so much discussion around here about converting USGS 1:100,000 DLG data, Digital Chart of the World, and, with MacDLG, the TIGER database. These are public-domain databases published by the US government (DCW is from the Defense Department). While the data is usually not free in the acquisition due to media and processing costs (though some is available through anonymous FTP), it doesn't have the severe usage restrictions the commercial stuff has.

hello this is  TED  HC5K A NEW COMER TO THE ARTS OF  APRS-GPS-AND MUCH TO
LEARN AND KEEPING UP WITH THE  TRENDS AND INFORAMTION....
I HAVE BEEN ON THE AIR  10.151.0 BECONNING AND HOPE I AM BEING RELAYED
ALSO...NOT SURE.. THRU   W7LUS...? ANY REPORTS... WILL BE WELCOME.

ALSO NEED SOME INFO ON EXACTLY HOW TO SSET UP A   2 METER TO  30 METERS
GATE   THRU A  KAM PLUS AND VEHICLE AND  BASE STATION... PROPERLY... I AM
THE ONLY
ONE IN ECUADOR SO NO WORRY ABOUT TOO MUCH BEACOING FROM VHF TO HF... BESIDES
THE  PROPGATION ETC.. ANY HEL ON THE ACTUAL  WORDING TO SET UP THINGS
PROPERLY..???

NEXT QUESTION IS THE  LOCAL  CIVIL DEFENSE AND AMATEURS  ARE TALKING ABOUT A
WEATHER SYSTEM THRU  PACKET  APRS AND AS FAR AS I HAVE BEENABLE TO LEARN SO
FAR  THERE IS TWO  SOURCES...   "ULTIMETER" AND  dAVIS".. THE QUSTIONSS  ARE
WHO IS BEST AND MOST ACCURATE AND ALSO  WHO DOES THE BEST  PACKET  FLOW THRU
APRS AND  THE DATA HAS TO BE COLLECTED IN A CENTRAL POINT FOR  SHORT FUTURE
EVALUATION AND ANALAISIS.. SO  HERE IS THE  HELP REQUIRED... WHO DOES BETTER
AND COMPLETE AND AUTOMATIC AND HOW EXTENSIE AND OPOTIONS ARE AVAILABLE FORM
BOTH TO SENSE, RECOLLECT AND TRANSMIT  WX  INFORMATION... THRU   APRS IF POSSI
BLE....??/ ANY HELP  AND  APPRECIATED... INDEED.

ALSO IF THE SYSTEM TAKES OFF PROPERLY THE AMATEURS LOCALLY ARE WILLING
EVENTUALLY TO INVEST AND INSTALL   APRS-GPS SYSTEMS IN SOME VEHICLES AND
SITES AND PLACE THEM  INTO  DIGITAL  MAPS  WHCIH I AM INPROCESS TO ACQUIRE
SOME THEL HAS BEEN OFFERED ON THAT ALREADY... PERHAPS WILL NEED SOME MORE....

I GUESS LAST QUESTIONS WIL EB REGRDING  ACTUAL  HARDWARE  FOR THE  WEATHER

WIL IT BE  KANTRONCIS  KPC-3'S AND OR MFJ AND OR  A.E.A. 'S AND  ANY OTHER
AT THE WX SITES  AND  WITH PERHAPS....  TEKK  2-5- WATT UNITS...AND  PROPER
ANTENNAS.. ETC...TO FORM A  NETWORK  FOR  WEATHER.....
 THANKS TO ALL
 AND CONGRTULATIONS TO  BOB BRUNINGA  FOR  HIS TREMENDOUS  EFFORTS... INDEED
AND ALSO   WINAPRS WHICIH I CALLED SEVERAL TIMES  BUT NO REPLY  YET AND MET
ALLOF THE TWO GENTLEMEN AT DAYTON... THIS YER.
```

ADIOS AMD WILL BE WATCHING 10.151 AND USUALLY RECORD ABOAUT AN EVERAGE OF
  10- 30 SITES PER NIGHT AT TIMES OTHER VERY FEW....

```

The following info is from Austin SummerFest '96 at the AMSAT presentation by WA5ZIB.

Launch: August 10, 1996 at 9 AM (CDT)
         Wharton County Municipal Airport

Payload: Lifting Body and one sub-package

NET: 7155 kHz before and during the flight (WB5UUK)

The lifting body contains most of the electronics. The vehicle will not be released for free flight, but will parachute back to earth after balloon burst near 100,000 feet. Package attitude and some flight control will be commanded from the ground.

* Color ATV camera with 2 watts output on 1255 MHz FM to a vertically-polarized ground-plane antenna. On-screen GPS and directional data included. Signal may be sufficient to be repeated through the HATS ATV repeater (421.290 MHz AM).
* GPS data (NMEA format) via AX.25 on 144.290 MHz FM. Other data from ground-control stations will be digi-peated through the system. The data should be APRS compatible, but the digi-peat function will NOT be open.
* Direction-finding beacon (carrier) on 433.915 MHz.

The sub-package contains a Basic-stamp computer with ten-meter transmitter (28.322 CW), a 35-mm camera set to take color photos every three minutes, a light strobe and a set of lithium batteries.

A CW beacon on 28.322 MHz sends three-digit HEX numbers representing the
on-board pressure transducer measurements. ...

> I too am interested in mapping sources. Does anyone know the differences
> between Street Atlas USa (Delorme?) and Precision Mapping 2.0?

Both derive from Tiger/1992 data from the US Census bureau. Both are thus
based on geocoded DLG from USGS data. And, unfortunately, both suffer from
the same nagging errors.

I really like the DLGs, but the Tiger files with geocoding are attractive
simply for the index to street-level addressing.

I've seen Garmin 45's for as low as $260 recently.(I think because they were
trying to unload an earlier version before coming out with an upgraded version.
As long as you have the data cord your Garmin45 will be complete. If you have
two ports on your laptop, you'll be set. Otherwise, with only one port, you'll
a hardware piece that switches between tnc and GPS. In WinAPRS, that hasn't
been fully implemented yet. In DosAPRS, I believe it is fully implemented.
I hope this gets you started.

Regrettably George, the Davis Instruments computer interface is more
than just a D/A converter...it contains the proprietary chip that
actually decodes the data and puts into useable format....so, yes, you
must purchase the unit, I don't know of anyone who has tried to do
otherwise.

>TIGER that were just fine in the USGS 100K database, which was where most of
>the TIGER cartography was supposed to have come from, while TIGER has important
>things updated that aren't in the 100K files. Go figure!

If you've got the time and patience, the TIGER data has a source code
in record type 1 so you can track down the discrepancies:

" "        Not Documented Elsewhere
"A"      Updated 1980 GBF/DIME-File
"B"      USGS 1:100,000-Scale DLG-3 File
"C"      Other USGS Map
"D"      Census Bureau Update Prior to Enumeration Operations
"E"      Census Bureau Enumerator Update
"F"      Census Bureau Update from Other Operations
"G"      Unconfirmed Local Official Updates
"H"      Census Bureau Update Post-1990 Operations
"I"       TIGER--Master Address File Building Operations

Above from Appendix H of the TIGER/Line documentation.

Also, you need to know which year of TIGER/Line you are using.  A lot
of stuff out there appears to be based on TIGER/Line 1992.  The
current TIGER/Line is 1994 and 1996 is due to start coming out this
month.

Oh yeah, TIGER/Line 1994 uses NAD27 datum and TIGER/Line 1996 will use
NAD83 (same as WGS84).  See the archives for discussion of the need to
correct detailed (1 mile) maps since the GPS reference datum is WGS84.

See http://www.cloud9.net/~alan/ham/aprs.

Subject: [APRSSIG:3529] Re: Garmin 45

I've seen Garmin 45's for as low as $260 recently.(I think because
they
were
trying to unload an earlier version before coming out with an upgraded
version.
As long as you have the data cord your Garmin45 will be complete. If
you
have
two ports on your laptop, you'll be set. Otherwise, with only one port,
you'll
a hardware piece that switches between tnc and GPS. In WinAPRS, that
hasn't
been fully implemented yet. In DosAPRS, I believe it is fully
implemented.
I hope this gets you started.

Hi All,

In addition to Mike Musick's program-in-the works, one
should also remember that WinAPRS & MacAPRS have the capability
of displaying DOS-style maps WITHOUT the 3000-point limitation
inherent in APRSDos. Alan Crosswell (N2YGK) made an excellent
street-level map of Westchester County using this method and
Tiger/Census data with a program of his own devision. To see
the results of this, go to the following url:

http://www.cloud9.net/~alan/ham/aprs/

and look for the "windows" map (I forget what he called it.)
Although it's technically a DOS map (open it up with a text
viewer,) it has over 212,000 points! DON'T try to use it with

```
APRSDos!  You'll scare the pojies out of it!  73

Arte Booten <N2ZRC@gnn.com>(preferred)  or  <N2ZRC@aol.com>(if necessary)
 (Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
  [Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

"I can't lock onto those coordinates, Captain.
There's too much subspace interference."

60. PROBLEMS GETTING NEW USER RUNNING / QEM / COM PORT / IRQ / BAUD

From: wa4ikq@nevets.oau.org (Geoffrey Dick)
Date: Tue, 6 Aug 96 00:10 EDT
To: aprssig@tapr.org
Message-ID: <m0undTU-000Qk2C@nevets.oau.org>
Rendered body type: text/plain

```
I put this question out for help on our local Florida APRS SIG and had
only 3 replies.  None of them addressed the use of memory managers. Then
again we have a lot of obstacles to overcome as you will read below. In
addition we would like to know if there is a library available of files
to replace the standard InitAEA.TNC such as for the AEA PK-232, so that
the user can smoothly reset his TNC after running PK Gold or PKPackratt,
and like-wise, a "RESTORE.TNC" file that would permit running the same.
---------------------------------------------------------------------
To: aprs-fl@tapr.org
Subject: [APRS-FL:102] PROBLEMS GETTING UP ON APRS IN ST. CLOUD

KA8ANQ, Edgar is having problems getting his computer with QEM memory
manager to work with APRS.  He also has a 4-port COM card and an AEA
PK-232 TNC that is giving him fits with the AEA Init file.  He complains
that APRS will not run after using PAKRATT or PKGOLD packet programs.
I encouraged him to reset his TNC with a special switch installed to
remove internal battery power.  He is still having problems and we need
confirmation from anyone who had an experience like what Edgar is going
through.

If anyone can help, please post a message so we can share this solution.

                         Geoffrey, wa4ikq@nevets.oau.org

> away to be of any use.

The differential signal broadcast by most folks is in RTCM SC-104 (Radio
Technical Commission for Maritime Operations, Special Committee 104) format.

It's a binary format that is generally understood by "DGPS Capable" receivers,
providing you follow their spec for piping it into the receiver. The USCG
beacons are using MSK at somthing around 300 khz to transmit the data. It's
not FSK and it's not going to make sense unless you have a program that will
decode it and present it as ascii data.

I've been working on a cheap-n-dirty DGPS broadcast system, and the data
format has been the real sticking point. W3IWI sent me some code fragments
that have helped a lot, but I've not been able to implement them yet into my
efforts... Maybe when I get more time after summer school?

There are several vendors for the MSK receiver/modems needed for this effort.
Check out http://www.csi-dgps.com as an example (although I've not used their
gear...).

Message-ID: <9607068393.AA839363633@mail.syntron.com>
Rendered body type: text/plain

It says in the WinAPRS documentation that it has been tested with up to ten serial ports under Windoze95... WinAPRS has no trouble opening the standard ports Com1/Com2 (3F8/2F8), but it fails to open Com3-Com10. I am using a Digiboard PC/8e with up-to-date Windoze95 drivers. I can access the ports using other programs, but not WinAPRS. I received my WinAPRS registration number yesterday, hoping that the ports had simply been disabled until I forked over $60...no dice.

Am I missing something? Is anyone else using a Digiboard? How is everybody else getting 10 serial ports?!?

```

67. Blackjack GPS Antennas to run again!

From: ku0g@sprynet.com
Date: Tue, 6 Aug 1996 15:08:14 -0700
To: aprssig@tapr.org
Cc: aprs-fl@tapr.org
Message-ID: <199608062208.PAA10971@m1.sprynet.com>
Rendered body type: text/plain

Greetings all! For those who were in the initial purchase of the Blackjack GPS antenna, Karla and I would like to say thank you for your orders and helping us get the initial purchase moved!!!

FIRST PRODUCTION RUN COMMENCING!

We are happy to announce our first production run of 50 units will begin in two weeks and we are taking advance reservations for these 50 beginning now! Two units are already consigned to existing orders that have been back-ordered to this point. These orders will have first priority on shipping. The remaining 48 units are up for grabs to the first 48 reservations received!

We anticipate shipment to begin the first week of September. As an incentive to those of you who wish to reserve units we are offerring a discounted price on the unit of $37.00 per unit plus $4.50 shipping/handling charge. This discounted price is only good for reservations received by August 18th.

To reserve your Blackjack Antenna, send EMail DIRECT to me at the address listed below. Include your full name, address, callsign and shipping address (if different from your address). You will receive a confirmation of your reservation and be issued a sequence number at the time your reservation is received. We will also mail you a printed order confirmation with an anticipated shipping date at which time you will be billed for all charges and requested to mail payment. Please do NOT send payment at this time!

ON OTHER FRONTS...

We have decided that we will not be producing an active antenna at this time due to the start-up costs involved versus the number of actual requests for an amplified version. We do offer a "weather-proofing kit" which will allow the user to place to Blackjack outside of a vehicle in the elements. There is ample room inside the radome for a KPC-3 or Pico-Packet TNC and, perhaps, even a small digital radio! Price of the Weather Proofing Kit is $15.00 plus $5.00 shipping/handling. This kit contains a radome (approximate dimensions 6 by 6 by 2.5 inches) and clear latex silicon for sealing purposes. If ordered along with a Blackjack Antenna the WP Kit is $11.00 and $3.00 shipping/handling.

Karla and I thank you for your support of our little cottage industry!

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

I'm looking for a source of suitable sized project boxes for GPS Stand-Alone Trackers. I don't want plastic or aluminum jnk boxes from Radio Shack. I'm looking for those nice formed, waterproof boxes, but I can not find a local supplier.

Any suggestions?

Try the local "Container-Store" Lots of fun boxes there.

I found the Ammo-boxes to be too big. I also wanted a small box that would not look "TOO interesting" when left in a car seat.

Don't forget an extra heat sink for the radio if used in the Hot parts of the USA and If you use a GPS with a LCD display watch out for below zero weather.

I just leave the Car GPS unit running for the
ONE night in Dallas when it gets too cold. :-)

OK, I've just uploaded TXBALOON.ZIP to the FTP site.

This zip file contains TXBALOON.MAP, which is a Mac/WinAPRS compatible map file created by MacDLG, the new map generation application mentioned the other day. Titled "Balloon Area Summary", it is a map covering a rectangle 90 mi. by 115 mi. centered on Wharton, Texas, the approximate area suggested by Ron Parsons as being useful coverage for their balloon launch this weekend.

Detail selection for generation of this map was major rivers, shorelines, primary highways, and tertiary roads (local arteries). Data is from the USGS 1:100,000 DLG database. The finished map contains 158K points, reduced from the original 210K points in the raw data.

There are a couple of things I don't like about this map. One is that the final point count is a bit high due to the current lack of filtering to eliminate small features generated by enabling "shorelines". This feature type seems to be a catch-all in the 100K dataset, but it's essential for capturing coastlines. The other is that there seems to be a problem in the road subtyping in the USGS data -- there are a couple of spots of dense local road detail that tell me that they coded local streets incorrectly.

Since I'm still writing some of the code, I can't get into a lot of detail about the program because I might make a liar out of myself in the interim. But basically it is a map generator that takes USGS 100K files and Census Bureau TIGER files and converts them to Win/Mac or DOS maps. It's not particularly fast -- that balloon map took two hours on my PPC7200/75 -- but I've generated maps with over 200K points without crashing the system around my ears. ;-) DOS maps -- that is, maps which will compress down to 3000 points or less after optimizing and smoothing -- take about five or ten minutes depending on how many DLG files we have to traipse through to collect vectors.

One key feature I like to talk about, though, is the vector optimization. This really cuts map size -- by as much as 40%. By doing a whole bunch of extra processing to try to locate and join related lines, intermediate points can frequently be eliminated, especially in metro-area maps with lots of straight-line streets. The optimization routine, frankly, is the lion's share of the time it takes to process a map, but I think it's worth it in file size reductions and faster map loading.

I have one more development release planned to wring-out bugs or feature problems, but I figure that MacDLG 1.0 will be out before the end of August. The only favor I ask of the troops is to not bug me too much about it until it's out so my development time doesn't get waylayed dealing with correspondence.

Iam looking to buy a GPS unit out of the Two Garmin units GPS-38 and GPS-45 which is the best unit feature wise and why.

Also is there a mail order company (that handles overseas orders) that i can order through that handles a visa card.

Do they have a email address.

I have not forgot the Magellan units GPS-3000

Thank you

72. GPS Week Rollover: A Problem?

From: Claude 995-5040 pager 4541 <CHEAD@exame2.dseg.ti.com>
Date: Wed, 7 Aug 1996 9:39:33 -0500 (CDT)
To: aprssig@tapr.org
Cc: CHEAD@exame2.dseg.ti.com
Message-ID: <960807093933.2040c06a@exame2.dseg.ti.com>

Rendered body type: text/plain

The following is an excerpt from the August 1996 issue of "GPS World", from the "Notes" section.

GPS Week Rollover: A Problem?

Some users are looking for reassurance from manufacturers that current and future GPS receivers are designed to accommodate a "rollover" in the GPS week, expected to occur in 1999, without causing temporary or permanent malfunctions in the equipment.

The satellite broadcasts the GPS week count in the navigation message as a 10-bit binary number that begins with a zero week of January 5, 1980. At midnight, August 21/22, 1999, the week count will reach the 1024 maximum and roll over - that is, begin counting from zero as though it were 1980 again. At issue is whether this rollover will create a discrepancy in data that GPS units might interpret as an anomaly, causing malfunctions during or after the event.
..
..
..
U.S. Air Force (USAF) organizations responsible for developing and acquiring the GPS satellites and user sets have included notices of the rollover in documents describing signal specifications. "The GPS Joint Program Office (JPO) is continuing to assess the impact of the GPS time rollover on military GPS receivers," says an Air Force representative. "Currently, we do not believe the JPO-procured military receivers will be impacted. However, each manufacturer, civil and military, has a unique design and may be impacted by the rollover, dependent upon the manufacturer's implementation of Interface Control Document (ICD) GPS-200 Navstar GPS Space Segment/Navigation User Interface."
..

Message-ID: <960807145244_71301.3106_FHJ88-1@CompuServe.COM>
Rendered body type: text/plain

Apologies to everyone!

I just downloaded the map created last night and discovered that the .ZIP file is corrupt. Since .ZIP is not a "usual" Mac format all I can figure is that I used the wrong save option on Zip It. If it doesn't work again (this time I'll verify the un-ZIP locally first <g!>), I'll be forced to upload it as a MacBinary .hqx file and you Win users will have to do whatever magic is required to decode it on your end.

Not planning ahead, I left the map file at home, so it will be this evening before a corrected version can be uploaded.

Again, I'm sorry for the false start.

Rendered body type: text/plain

I use polycarbonate boxes from Pomona Electronics. They are at least water-resistant with neoprene gaskets. They are well designed and rugged. They come in the following sizes:

65x58x35mm
115x65x40mm
115x65x55mm
115x90x55mm

171x121x55mm
222x146x55mm

You can get them direct at 909-469-2900
Newark Electronics also carries the Pomona line.

Pomona makes other styles as well such as thermoplastic, phenolic, and die cast aluminum.

To: aprssig@tapr.org
Message-ID: <m0uoAJR-0001HCC@wa4mei.radio.org>
Rendered body type: text/plain

I've made some improvments to the Atlanta area APRS server.

1. It will send you all the APRS data it has collected during the previous 15 minutes (less dups) when you first connect.

2. I think I've finally identified and fixed the crashing problem.

Don't be shy about connecting to the server ;-) I need some user load to make sure the bugs are really fixed.

Two individuals using Win95 and Netscape 2.02 have reported that the South East and Atlanta regional maps don't work. My Linux Netscape 3.0b beta crashes after loading the Atlanta detail map but works fine with the others . I don't know if these are Java implementation problems or bugs in the Java applet. All maps work with the Java implimentations on Macintosh and OS/2.

If you get different results let me know.

Browsers can reach the server through:

http://www.wa4dsy.radio.org/aprs/

You can telnet to the server at on port 14579 at

telnet://wa4dsy-3.wa4dsy.radio.org:14579

> When's the Coast Guard going to do this thing?

W3IWI did this from Goddard SFC a couple of years ago. I've accomplished the same thing for Cows In Space, too.

You have to set the thing up in TRANS mode, I use a pactime AFTER 5, and then you decide on the DGPS interval, either 15 or 30 seconds... Anything beyond that and you've diluted your benefit pretty significantly.

Hammond or Vector make both aluminum and plastic boxes.  If memory serves me
(often a gross assumption) the plastic ones can be hermetically sealed, the
aluminum ones are not gasketed.

Zero makes both plastic and aluminum boxes that can be sealed.

I took standard Hammond die-cast aluminum boxes and sealed them with Dow
Corning 737 (doesn't make acetic acid when drying) for the Cows In Space
project, and was quite satisfied with the result.  The only condensate
corrosion we saw was as a result of sealing the boxes in a high humidity
environment and letting the vapor condense.  The cows never got 'em wet on the
inside.

>Hi.

the diferencial corection are in a format called rtcm and is an ascii

i hope that the transmision is ascii around 100 or 300 bauds.(some times less)
try to decode in this way ==> ascii
also you can play with inverter ascii or maybe the marc or space tones are
not standard
i dont have work with the pk232, but i think that you can change the
frecuency of the tones. i have do that job with the kantronics kam in this way.

good luck

gerardo

81. APRS (LIVE) WEB PAGE

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 7 Aug 1996 13:31:15 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.94.960807131115.5033C-100000@arctic>
Rendered body type: text/plain

My APRS web site is now on line using KO4HD's javAPRS to give you a live
display of several APRS networks monitored here in Annapolis:

http://web.usna.navy.mil/~bruninga/aprs.html

Besides the usual replay files, are 4 live map displays as follows:

AMATEUR RADIO ALL	(145.79 all stations heard (last 250 packets)
AMATEUR RADIO CURRENT	(145.79 only last 2 hours of packets)
HF APRS	(10.151 MHz LSB)
ACADEMY	(6.261 MHz USB
ACARS	(131.55 MHz AM shows commercial aircraft)

I have a small program running on a PC that every N minutes sends over the
last 250 packets heard. These packets are filtered to remove all dupes.
For now, N is 10 minutes. During special events, we will change N to be
every minute or less. This gives you a complete map page instantly when
you link to my APRS rather than having to wait for the data to dribble
in...

Per murphy's law, our file servers are up and down during summer upgrades
going on, so if it doesnt work, then try again later...

This has been working for a week, but not externally. Steve figured out
the problem, and that is that our http server "assumes" that .map files
are to be treated as graphics, so it was getting messed up on the .map
files we were using with javAPRS.

Hi,
I am President of DCI, the worlds leading supplier of DGPS.  We currently
broadcast over FM subcarrier, and are operating in 11 countries.  I have
been toying with the idea of putting the corrections over packet.
In the US, we utiliza a wide area network, connected together via frame
relay.  We process the data here in Cupertino, CA, and uplink it to Raleigh,
where it is then broadcast to our radio stations over Ku utilizing FM
squared technology.  We currently broadcast over 160 radio stations in north
america, covering approx 1.6 million sq miles.

The signal is encrypted, and provided on a subscription basis.  We have 3
levels of service, 1,5, and 10 meter.

What I have toyed with is broadcasting the 10 meter service free, but
charging for the 1 and 5 meter service.  This can be done by scrambling part
of the correction, but leaving the rest of it in the clear.  We could
provide a small inexpensive connector device which unscrambles the high
accuracy bits.

What do you thing of this idea.  10 meters is certainly accurate enough for
the APRS marketplace.

All manufacturers use RTCM SC104.  This is a well defined format.  Any
receiver that is differential ready will take in this format.

You cam get receivers from the USCG, of from commercial operators like DCI.
Check our web page at http://www.dgps.com for coverage and moer info.

Rendered body type: text/plain

```
As you know, APRSair will plot the location of commercial aircraft heard
on the ACARS frequency of 131.55 MHz AM if you have a TNC capable of ACARS
decoding.  I am using a DSP-12 but I have heard that AEA makes one too.
With a roof top antenna, I typically see aircraft out about 200 miles.

I just added the ALT-SETUP-MODES-REPORT-acars mode that will then transmit
an APRS packet out the other serial port on the PC as an object report.
These packets are transmitted to the address of ACARS instead of APRS,
however, so that normal APRS operators dont see them.  But if someone
wants to see where some commercial aircraft are, they just set
CONTROLS-FILTERS-OTHER and then they will begin to see these packets...

If they want to plot ONLY the ACARS posits, then they can use the
ALT-SETUP-MODES-ALTNET command to watch for ONLY ACARS traffic.

I did this so that these ACARS packets can be linked over to my APRS web
page so you can select to see the commercial airlines in the area...

88. Formula for distance between points?

From: John Ackermann <jra@febo.com>
Date: Wed, 07 Aug 1996 19:39:44 -0400
To: aprssig@tapr.org

Message-ID: <199608072339.TAA18611@ag9v.ampr.org>
Rendered body type: text/plain

I wonder if someone can help me out... I used to have the formula (actually, the code) for calculating the distance between two lat/long pairs. Now that I need it, I can't find it anywhere around here. Could someone forward it to me, either via private mail or the list.

Why do I need it? I want to write a filter program that will read a .HST file and output some useful stuff: Mainly, it will let you filter out closely-spaced points. When I travel, I read the GPS data at 5 second intervals, but that makes for very slow displays of "where I went on my summer vacation" (though it allows for very neat displays over small areas). I want to be able to extract points that are, say, 1 mile apart to make a neat and speedy playback.

I'm also toying with summing the distances between the individual points, and comparing with the distance calculated using only the first and last points, to determine how direct a route is compared to a straight line. And, while I'm at it, I want to capture the furthest N/S/E/W, max, min, and average speeds, etc.

If someone will help me out with the key formula, I'll make the resulting Qbasic program available to all comers.

Thanks!

John   AG9V

Well, it took an Act of Congress, but the MacDLG demo map, TXBALOON.MAP, has
been uploaded to the FTP area. The *correct* file is:

    txbaloon.zip.hqx

Apparently the uploader I use at home does funny things to binaries, and as
some of you might see it took several tries to get the file there successfully.

For those who take the time to download it (thank you!), let me know what you
think.

Oh where is Tom Clock and his Totally Accurate Clark when you need him ?? :-)

Year    EVENT
-----  -------
1999   GPS clock rollover -- August 21/22, 1999
2000   Computer software might have problems with the 00 -- Jan 1 2000
2001   The new millennium starts Jan 1 2001

The next century will also start on Jan 1 2001 , but we in the USA are not
15th in the world in Math and Science for nothing.

Just like the computer screen display in the movie "Independence Day"
We need Tom to include with his Totally Accurate GPS clock ,a count down
program that showes time to the new millennium.

Lots of people slip up on this:
The news said the first Olympics of the new millennium would be held
in Australia.

>Iam looking to buy a GPS unit out of the Two Garmin units GPS-38 and GPS-45
>which is the best unit feature wise and why.
>

Here are a couple of differences to keep in mind:

1. The 45 (or 45XL) has an easier way to connect an external antenna in
that the unit has a BNC connector for the stock antenna.
   The 38 would require you to use one of those "special" connectors, if
it could be done at all. A quick look at the Garmin Marine Retail Price
List (which also lists accessory items for each unit) shows that an
external antenna is NOT listed as an accessory item!  External antennas
are listed for the models GPS-40, GPS-45, etc.  Buyer Beware!

2. If you want to feed the units with external power, you must feed the
38 with a regulated source of 5-8 volts.  The 45 will accept a source of
from 5-40 volts, which means you can use any convienient 12v source.

3. The 45 comes with a carrying case.

Most of the other specifications seem to me to be identical.

Hope this helps...

Hi, Ron- glad to see you on the SIG. You popped in at an appropriate time in these discussions. My little project here in Atlanta is complete, a roaring sucess! It actually saved the day on Sunday Morning's big event, when it was used for its intended purpose (helicopter was "IFR on top"), motos were amongst downtown buildings.

Hope you're copying more APRS packets up there now and welcome to the SIG.

Ralph Fowler, N4NEQ

APRSdos REPLY COMMENT: For that application, you have a flat earth and th difference between points is just the normal distance formula

d = sqr(LA ^ 2 + LO ^ 2)

But then you can be more accurate if your multiply the longitude value by the cosine of the lattitude. Oh yes, one minute of latitude = 1 nautical mile... This should certainly be accurate enough for distances under 100 miles... (relatively speaking) since you are only interested in a relative distance measurement. If you want an exact distance to feet, then you need the real solution...

Awhile back John Fricks wrote:

Following is an Excel spreadshhet implementation of the
Great Circle formulae:
```

Objective: Distance and azimuth between major cities

```
Enter coordinates of origin: (Nairobi)
   ORGLAT          -1.2833
   ORGLON         -36.8167
Enter coordinates of destination: (Dar es Salaam)
   DESLAT          -6.8000
   DESLON         -39.2833
Are both locations in the southern hemisphere?
   SOHEM                 1   =IF(ORGLAT<0,IF(DESLAT<1,1,0),0)
Is origin closest to the pole?
   NSF                   0   =IF(ABS(ORGLAT)<ABS(DESLAT),0,1)
Let point B be the one closer to the pole
   BLAT            -6.8000   =IF(NSF=1,ORGLAT,DESLAT)
   BLON           -39.2833   =IF(NSF=1,ORGLON,DESLON)
Let point A be the one closer to equator
   ALAT            -1.2833   =IF(NSF=1,DESLAT,ORGLAT)
   ALON           -36.8167   =IF(NSF=1,DESLON,ORGLON)
Use this constant:
   RAD             57.2958   =360/(2*pi())
Now do some spherical trigonometry:
   LONDIF          -0.0215   =((BLON-ALON)/2)/RAD
   LATDIF          -0.0481   =((BLAT-ALAT)/2)/RAD
   LATSUM          -0.0705   =((BLAT+ALAT)/2)/RAD
   YXDIF            1.1511   =ATAN((1/TAN(LONDIF))*SIN(LATDIF)/COS(LATSUM))
   YXSUM            1.5693   =ATAN((1/TAN(LONDIF))*COS(LATDIF)/SIN(LATSUM))
   Y                2.7203   =YXSUM+YXDIF
   AZY            155.8637   =Y*RAD
   X                0.4182   =YXSUM-YXDIF
   AZX            -23.9622   =-X*RAD
   Z               -0.0527   =ATAN(TAN(LATDIF)*SIN((Y+X)/2)/SIN((Y-X)/2))
Calculate great circle distance from between points:
   KM                671.2   =111.12*(2*ABS(Z)*RAD)
   MI                417.1   =69.05*(2*ABS(Z)*RAD)
Calculate azimuth from origin:
  (Note: AZY is the azimuth if both locations are in northern hemisphere
and
  the origin is closer to pole. AZX is the azimuth if both locations are in
   southern hemisphere and the origin is closer to pole.)
   AZ1               155.9
=IF(SOHEM=0,IF(NSF=1,AZY,AZX),IF(NSF=1,AZX,AZY))
   AZO               155.9   =IF(AZ1_<0,360+AZ1_,AZ1_)
```

Dar es Salaam is 671.2 km. from Nairobi. From Nairobi, depart along azimuth 155.9 degrees.

Actually, the GPS 38 doesn't accept an external antenna at all. The "special" external antenna connector that was on the 40 is gone from the 38. (At least, I couldn't find it in the same place when I looked at a 38, and I have also heard it doesn't exist.) I'm rather irritated at Garmin for removing this but...

I suppose you could have an external, active antenna and radiatively couple to the 38 by placing some sort of radiating element on your active antenna output over the 38's receive antenna.

Hi Jim, I just started to get the messages form APRS and noticed that there is discussion about Differential GPS. I have always wondered if there was an aprs specification that would allow the transmission of differential GPS corrections? Because the generation of corrections is really quite a simple matter. And we (amateurs) would not have to rely on corrections from other sources, as we could do them ourselves.

Thanks

New features. Just added satellite pages from APRtrak. You can now see the positions of the AMSATS and some GEO birds. Not only can you select the usual map display, but also the AZ-EL view from Wash DC. I will probably make multiple cities available. FOr now, dont worry if the SAT positions are not exact, I will update the keps when it is all running fine.

Also if you have had problems linking to our site, SO HAVE WE. The file server has been more down than up these last few days...

```
  http://web.usna.navy.mil/~bruninga/aprs.html
             ^^^^
```

I may have put out an earlier address with nadn instead of usna as shown above...

Hi Ralph,
I broke down and bought myself an ICOM IC-Z1A. Am now hooked. Will have a DGPS version working soon I hope.

Jim,
Tell me a little about your wide digipeater. Whats nice about our signal is
that it is the same everywhere. What changes it the location of the Virtual
Reference station and the local weather. From whar I see, the weather
doesn,t need to be broadcast, as you seem to have ample access to this.
regards,

Don,
You can do it yourself.  You need to purchase a GPS receiver that outputs
RTCM.  Typically $4-6,000.  You also need to survey the antenna correctly.
A  good survey is around $1500-$3,000.

lets hear more!
how involved is it? I know you need a dedicated GPS, but how are the
corrections encoded for input, broadcast?

Thanks for your time

Why?  Just use any receiver you can dedicate to the job, have Bob
Bruniga write a patch to APRS that does the correction from your
surveyed position and then transmits an APRS correction string that can
be interpreted by APRS at the receiving end.  Of course this means you
now have to use APRS & a computer at the WIDE.

>  You also need to survey the antenna correctly.

Most real repeater mountain sites are already surveyed.

Subject: All this talk about differential

When I first started with aprs I thought I just HAD to get a
```

diff gps reciever for my tracker. Now, after about 2 years, I think the
effect has faded a bit.

Dont get me wrong, I think access to higher accuracy GPS fixes is a great
idea, and boater and whoever else wants it should be able to get it.

BUT

For APRS, and strictly aprs, why bother. Do we need 10 meter resolution to
watch someone out on the water, in the air, or driving around town.
No, I dont think so. Perhaps you could argue that other uses of GPS demand
great resolution. I would not disagree. BUT we arent flying planes with APRS,
nor are we surveying land with aprs. Nor are we using it for an anchor alarm.
ITs just for fun and the resolution of 99 feet and sometimes 66 feet is good
enough for that purpose. (for me) Who cares if Im 40 feet off..? In the
maps we have of Fl, it is pretty easy to tell where someone is, and greater
resolution is GENERALLY not needed.
I say, if you want to play, go ahead..but lets keep it in perspective, all
this fuss about higher resolution (AGAIN ONLY FOR APRS) is confusing.

Another issue..and it's one I bring up for the sake of discussion.
IT MAY BE "illegal" to duplicate a service that is already available
commercially. EG DGPS corrections on packet. This can be obtained by CG or
pay services. When I wanted to play wx man, everyone freaked out because it
was DUPLICATING another service that was available. IE the wx stuff. Im not
saying it IS illegal, but individual operators may want to
think about this.

Sure go ahead and flame...But recall this please, This issue is for
discussion not hot headed illogical comments. Try to impress us with your
ability to verbalize intelligently your opinion, and not flame.
Perhaps you may even change my mind, as I am open to the whole thing and only
desire enlightenment.

Hi Bob...
I am running a U2000 with the outside humidity and
the wireless .01 inch rain gauge.
Is it possible to have aprs save to a one line file the
wx as in the P list so that if the power goes out that
the rain and percipitaion readings do not start at zero
when you bring aprs back on line. We had over 1 inch
of rain in an hour yet my aprs said we had zero rain
because we had 4 power outages in that hour
and aprs does not store the rain gauge totals in a file
as it updates.
The U2000 is showing 1.65 inch of rain since 8am today
and aprs is showing R022/P039 since the last power
outage this afternoon.
It shure would be nice to be able to send
out the correct info in situations like this..
tnx in advance de Ron

All nice but If I remember correctly with SA turned on it's +/- 150
meters, that's +'- 450 feet not 99 feet, there is quite a bit of
difference. Also the garmin 45 says accuracy with SA off
is +/-15 meter's that about +/- 50 ft accuracy......
boy I would be glad with your accuracy of 99 or 66 ft
accuracy.........

> this fuss about higher resolution (AGAIN ONLY FOR APRS) is confusing.
> Yes, generally speaking we don't need it. However, if you are doing Search and Rescue
in the Amateur Service, it is VERY important to know where "things" are located. The
Probablility Of Detection or POD is a mathimatical formula used by professional SAR
teams when searching for a person or object. If we have abso-darned-lutely good
location info on just where the SAR team members WERE when searching, then the
management portion of the SAR team can plot where the next team of searchers should pay
special attention. In other words, the probibility of detection is increased
tremendously!

>
> Mike
> KD4EMI@AOL.COM

Mike has an interesting point. Is it illegal, or in a grey area? I for one would LOVE
to find out from a commercial source, the costs of using this service for a non-profit
(as defined in IRS reg's) SAR organization, AND the coverage area of that service.

Emergencies just don't happen in the local area all the time, and it's possible that a
SAR team could be sent outside their "hometown" area where the error correction "node"
is located. The only way, at the present time, I can see getting corrections, is thru a
commercial service. Can anyone add to my statement?

Formula will be found in any spherical trigonometry textbook or
handbook of mathematical formulas.   The formaula you want is called
the law of cosines.  it can be coded in one line if you just want just
distance.
if you want an azimuth bearing, it gets tricky as you have to use law of sines

too and figure out what quadrant is the real one. GL

Its funny that this subject should come up at this point since I just had my
PVT-6 tested on our $100,000 GPS simulator at work last week. For what its
worth, my unit DID roll over correctly as expected. We even it got it to come
back to its senses for the correct date & time, for that particular day in time,
without any ill effects. To this day, its still working fine.

APRSdos REPLY/COMMENT:  This Pseudo Differnetial is built into APRS for
the last year.  But it is only of value if your mobiles and your base
station GPS units are locked onto EXACLTY the same satellites.  Back when
there were only 3 visible most of the time, that worked.  Now with 8 in
view and 12 channel receivers, its not worth the trouble..

I have recently switched to Windows 95 and have discovered a
woe of  cpu resource sharing. With APRS 7.6f, Mscat format, running
in the background, what is normally a .25 second blip is now a 15 second
aggravating monotone. Toggling the beeps on or off  makes no difference.

  Short of  keeping the program on screen or assigning more time than
it needs (assuming that is possible), is there a more reasonable
solution than suicide?

                                    Pete/wa4hei

Rendered body type: text/plain

```
On Thu, 8 Aug 1996, Ron Haley wrote something like this:

> I ran the SAREX/SPRE satellite APRS replay.  Neat!  What does it take to
> communicate via these satellites.

APRSdos REPLY/COMMENT: There are at least 5 amateur satellites that I can
think of that have are currently capable of relaying APRS position
reports.  They come over about 6 times a day each.  This could give a ham
on remote travels as many as 30 reporting opportunities a day if he was
lucky.  For the PACSATS (3 of them) you need a special $250 TNC to
transmit and receive.  BUT!!!  to just TRANSMIT your position, you only
need to XOR the packet from a conventional TNC with its 1200 HZ clock!
and feed that to the MIC connector on any 2m FM radio!  Total cost about
$2 maybe... (still waiting for someone to show us where to hook it up)

Since we now have javAPRS that allows anyone with a web brrouser to
see APRS position maps LIVE, it is trivial to have a link to a web
page that is monitoring the PACSATS.  Then everyone can track the
mobile without needing a special satellite modem for receive.  Our
javAPRS web page (still under development and down as much as it is
up...) already displays several live nets:
    VHF APRS (145.79 in the mid atlantic states)
    HF  APRS (10.151 LSB nationwide)
    ACADEMY  (Locations of USNA boats along atlantic (HF))
    AMSATS   (current locations of AMSATS)
    ACARS    (Positions of commercial aircraft monitored on 131.55 MHz)

I guess since I have a spare satellite modem I could set up the APRS
satellite monitoring station for the East coast.  We would need one for
the central and west USA too, plus other countries.  These web sites would
then be able to display the locations of any GPS mobiles within their
footprints.

Typical applications, would be tracking HAM expeditions, HAMS at sea, or
just about any epic journeys where amateur radio plays an important
role...  THere are lots!

Even without the $2 standard TNC mod, anyone with a PACSAT modem could be
on the air today to begin experimenting with this exciting capability!
I would begin the receive site tomorrow, but every antenna for my lab has
been temporarily removed while they re-do the roof (a 3 month project).

APRSdos REPLY/COMMENT: I did get a chance to play with Mscat mode the
other night, and noticed a lot of inconsistencies too that need to be
fixed.  No time, and im on travel..  So lemme summarize what I think I
learned:

 1) Put APRS in Mscatt mode  (i donno about the report above)
 2) Be sure to set digi to none (may have to use OCT screen direct)
 3) set your alt-BCN to something very short...

Confirm that it is working by monitroing with another TNC if possible.

Good luck!  WIsh I was going to be here...

To: aprssig@tapr.org
Message-ID: <199608091454.KAA26446@ag9v.ampr.org>
Rendered body type: text/plain

```
I'm trying to replay an APRS .HST file in WinAPRS, and don't have a clue how
to make it work.
```

I have tried putting the file in the winaprs directory, as well as in an "hsts" subdirectory (as in dos APRS), but when I click on the "Replay Tracks" command, all that I get is a short beep.

Is the file naming, format, and/or location different for WinAPRS? What do I need to do to replay my tracks?

Thanks for any help.

Robert's point is well taken... And he's right about the new millenium starting 1 Jan 2001... (sheepish grin)

The problem is, did the GPS geeks at DoD recall this as trivialists or did they apply standard engineering llgic to the problem and the rollover date *will* be 1 Jan 2000?

Er, ah... I guess I'll wade back into this.

Ron's comments are on-track, if a little optimistic concerning costs. Our DGPS base station receiver is on the order of $10k, and our survey-grade receivers, $24-44k.

While getting all the data from a $300 Motorols or $400 Trimble OEM GPS receiver engine is straightforward, I've spend a lot of programming time trying to format it properly and have come up short. Still trying, but I suspect it cannot be done in either QuickBasic (which is the mother of APRS) or VisualBasic.

The essential problem here is that
1) RTCM corrections are not ASCII, but binary.
2) RTCM words are 30 bits, bitstuffed as 24 data bits with arbitrary boundaries, and with 6 bits of "checksum" which are not standard checksum data.

The "surveys" available for most repeater sites are not good to the meter level. That's a minimum definition for the base station precision and accuracy, or you're just not doing it right.

DCI (and Ron) do this for a living. Me? I just do it for research, which is *MY* living. Resolution of the corrections is not really trivial. More's the pity.

Now. To expand a bit onwhat I *THINK* you're thinking: If you have a high accuracy survey of the receiver antenna position, you can attempt to "correct" differentially by having APRS ship and process a position "delta." This will work fairly well within a smal area around the base station if you have the following:

1) All receivers, both base and rovers, are of the same receiver design
2) All receivers use the same algorithms and constants for pseudorange estimates
3) timing of corrections is tightly controlled and the corrections are calculated based on the received epocha nd the corrections epoch matching...

doesn't do much good to correct something with a correction that is different
from your basic determinant epoch
4) The receivers are all in the same immediate area, and have appropimately
the same pseudorange and geometry
5) (THE KICKER) All receivers *MUST* be using the same satellites

RTCM corrections are a more general solution, as they incorporate pseudorange
and pseudorange rate corrections to all satellites the base can receive.

If all 5 of the above conditions are met, and "corrections data" are
transmitted at least every 5 seconds, I'd be able to hope for (not expect)
about a 10-15 meter ellipsoid of error.

73, gerry

With SA on, it's +/- 95 meters 2drms 95th percentile.

Or, it's about 71 +/-24 meters 95 percent of the time and somewhere in a 1AU
radius of the Sun 5% or less of the time :-)

>
> Best I've seen is 54 feet and that was right around the middle of May this year.
> Most of the time I see something in the 66 to 80 range here...

Actually, I've resolved the error to less than 3 meters several time in the
early summer, using a Trimble SV6 evaluation board with carrier phase
smoothing turned on. My PVT-6 has been documented in that range, or better,
for autonomous position determination repeatedly, when compared to
well-surveyed sites her at Texas A&M University. Also, last summer, when SA
was still cranked up, I was able to colocate with a survey GPS and collect
data for a period of 22 minutes, and resolved the horizintal error to <1.5
meters, and vertical error to < 2.3 meters, using some code that collected all
points ona 1 second update rate, and kept all with a PDOP < 4 and at least 5
satellites in the solution.

SA has not been necessarily turned off, but its effects apparently have been
minimized, based soley on some of the data I've seen since about 15 March
1996. I've also seen, however, short periods of significant, apparently
SA-related degradation when certain satellites are over the White Sands Test
Area. I suspect some anti-spoofing/anti-jamming research is in progress, but
have no (legitimate) mechanism of ascertaining such.

> CD-ROM? It's a real pain to have to manually go in and put in major streets
> (non-highway) and county roads.

What do you mean by "level 3, 4, 5, 9 and 10"? Do you mean *class* 3, 4, 5, etc., or *subtype* 0203, 0204, 0205, 0209, and 0210?

Two factors may be at work here. One is that the map makers ('cept MacMapMaker) are oriented towards DOS APRS, and consequently are hugely concerned with data volume and have set some arbitrary cutoff point. The other is that I've found the 100K DLG data to be extremely inconsistent in assigning class levels. A "class 3" road can be anything from a major - but unnumbered - metro artery to a dirt path in a residental development somewhere out in the sticks to not being used at all in a quadrant's dataset. This is immensely frustrating.

This severe inconsistency may mean that a test set used during a particular program's development may not have had the same feature subtyping relationships as the map sets you're working with. I've worked with maps from five different areas so far, and am finding new things with each one. It's going to be impossible to test with every possible DLG file.

In MacDLG, I've had to rely a lot on route numbering subtypes to identify major routes, and even that is flaky. Identifying class 3 roads has helped, but unfortunately DOS APRS doesn't provide for a tertiary road class; it's Interstates, US highways, state routes... and then everything else... oops. But such is life with only 15 possible line feature distinctions.

You've given me some food for thought, though, for Mac/Win maps. I might be able to very quickly program a distinction for class three routes, by making class 3 routes show-up as regular gray, and then class 4 or less becomes light gray. I already have a request for class 5 roads (trails) in the mill.

Neither illegal nor gray. If duplicating a commercial service was illegal, then most of the activities we do would be illegal. Talk on the air? Duplicating the telephone. In the car? Cellular. SSTV? Send a fax.

I think that the confusion is in the prohibition of retransmitting commercial services. Taking the 10 meter data and directly resending it on 2m is probably illegal, but using the output of your own GPS receiver (which is creating the data) would not be.

Some free advice.. but remember you get what you pay for! (Just don't ask the FCC if it's legal. They'll probably say no, and then it IS illegal. It's better to just do it and ask forgiveness later if they do decide it's illegal.)

Actually, I had two thought processes going at the same time and they got
melded during typing...

I think Bob has already tried the above method and it suffers from the
things you point out here.

The better solution is to find a way to code or encapsulate the RTCM
binary data and use the digipeater to transmit it to the users. Then
APRS (or other software) can decode it and send it on to the GPS. I see
you have been working on the coding, there must be a way...Is the RTCM a
contant stream or could it be broken up into packets?

Sending the RTCM-104 data is no problem. Just broadcast it as UI frames to APRS TNCs.

The problem is in generating low cost RTCM-104 data.

DGPS basically is a packet. There are two main types of message types,
namely type 1 and 9. Type 1 contains a header and a record for each visible
satellite. Type 9 contains a header and data for a smaller number of
satellites.
GPS receivers treat them differently, but I don't want to go into this here.
Basically its a binary stream of data, and as long as the RTCM data that
goes into the TNC is reproduced faithfully at the other end, you have an
RTCM message.
The header info added by APRS should be dropped by the GPS receiver, however
some don't do this well.

This is exactly right. That is where DCI might be able to help. We are
also looking at doing real time traffic data. A format already exists for
broadcasting this over the FM RDS subcarrier. Could also apply to APRS.

APRS Perseids Meteor Scatter Test Announcement

Date and Time:   August 11 0000 UTC to August 12 1200 UTC
                 (August 10 2000 EDST to August 12 0800 EDST)

Frequency:       145.79 and 50.62 MHz (if available in your area)

Mode             1200 baud AX.25 packet

   All amateurs are encouraged to participate in the Perseids meteor
scatter test August 11-12. Although 6 meters is better than 2 meters for
meteor scatter work, everyone has a 2-meter radio and we can make up in
numbers what we lack in performance (during the 1995 test, numerous
stations received packets from 600 to 1000 miles away and a handful even
copied stations over 1000 miles away... on 2 meters). All you need is a TNC
and, preferably, high power and a beam. The objective is to see how many
grid square (DX) packets you can receive over the 36-hour event (a
successful connection would be icing on the cake).

   Stations in the four quadrants of the continent transmit alternately for
15 seconds (the quadrants are formed by the 39 degree north latitude and 96
degrees west longitude). There are two ways to do this: (1) by using the
Meteor Scatter (MS) mode built into the DOS version of APRS or (2) by
placing your six-digit grid square in the Unproto To call sign field, for
example, WA1LOU>FN31MP.

   Suggested procedures for the test follow:

   1)  Point your beam towards a major population area 500 to 1000 miles
away in one of the other US quadrants. If there is another active local
station, coordinate your beam headings so you are not both hitting the same
azimuth and receiver target area.

   2)  Enter your grid square into your TNC using the following command:

          cmd: UNPROTO FN31mp

where FN31mp is your six-digit grid square. If you can't estimate the last
two digits, use aa. Note that no Via Digipeater is used.

   3)  For attended operation, enter the Converse Mode (cmd: CONV). Each
time you hit carriage return <CR>, you send a packet. Hit 20 <CR>s
and you send 20 grid square packets. Synchronize your clock with WWV
and transmit as many packets that you can according to the following
schedule:

   Northeast stations transmit between 00 to 14 seconds of each minute.

   Southeast stations transmit between 15 to 29 seconds of each minute.

   Southwest stations transmit between 30 to 44 seconds of each minute.

   Northwest stations transmit between 45 to 59 seconds of each minute
```

4) Alternatively, run APRS DOS version 7.1b or later. Its automated meteor scatter mode plots received packets on a map. (Read the file METEOR.TXT bundled with the latest releases of APRS.)

By the way, only stations running at least 100 watts into a beam antenna should transmit. Anything less is unlikely to propagate packets via meteor scatter and just causes unnecessary QRM. For example, during last year's test, I transmitted 150 watts into an 11-element beam and nobody reported receiving my packets!

Even if your station is not a powerhouse, you can still participate by monitoring the test. If you are running APRS, each received grid square packet is plotted on a map and entered into the APRS Heard log.

If you are not running APRS, set the clock in your TNC and enabling the time-stamping function so that each monitored packet displays the date and time of its reception. This makes logging received packets easy and permits unattended monitoring and logging when you are unable to sit in front of your computer. Watch for stations sending packets containing grid squares. Make a note of the grid squares that are 500 to 1200 miles from your QTH. When you receive a grid square from one of those, you know you have hit pay dirt. If you are running 100 watts or more into a beam antenna, you can try and make a connection with that station, too!

After the test, I will need your reports to see how we did. Your reports should contain the following information:

Your call sign

Your state/province

Your grid square

Your effective radiated power

Call signs of received/connected stations

Grid squares of received/connected stations

Time of reception/connection in UTC and number of received packets

Distance between you and the received/connected stations

Send your reports by email to:

stanzepa@nai.net

Or by mail to:

Stan Horzepa, WA1LOU
One Glen Ave.
Wolcott, CT 06716-1442

Have fun!

Hi Mike.
The problem here is that when I generate county level maps (I'm taking several 2 mile maps and merging/crunching them here) the COUNTY "LETTERED" ROADS aren't coming out. I can interpolate their position fairly well, but am relegated to taking paper maps and trying to get as close as possible to the correct spots. This just isn't personally acceptable to me as I'm trying to be as dead-on accurate as possible. These same classes of roads also tend to be the major thoroughfares here in KC area: they are major arteries but not highways as such. These are USUALLY easier to put in place as they are, for the most part, straight lines...

Still and all, I'd like to see ALL road data extracted and, as you said, assign different color shadings. The mapfix program could then be used to change the colors to whatever is appropriate....

Ken, John: Are you all getting this? Hope this is a good idea....

Hi Jack. I'm using the 100K DLG (optional format) files. I consistently get major thoroughfares left out (such as lettered county roads and major city streets) with your program, Kens program as well as Ken's CONV100x.EXE

The CONVxxx program tries to output 10 files starting with interstates in 1, US highways in 2, State Highways in 3, etc. right down the list. 7 and 8 generally are the street level. I never get anything is 5 or 10.. Of course, this is Ken's problem, Jack, but it's just a way to describe the kind of problem that I keep running into with your program and his. Nothing personal, of course. Considering how difficult it is to manually draw maps or even to take the converted files from CONVxxx.EXE and generate a map, it's not a major deal, just something I would hope you guys could take a look at...

Thanks for the reply!

Hi Joe,

On Fri, 9 Aug 1996 you wrote that:

>We are in the works of installing a new APRS digi on 145.790
>in Schenectady, NY (close to Albany). Are there any other APRS
>digis nearby?

     So far as I know, there is a distinct LACK of stations in
that area on APRS.  From my location in The Bronx I only see
two stations to my north with any regularity (N2YGK in Briar-
cliff Manor is the more northerly of the two with a beam facing
south and N2SF in White Plains running a WIDE.)  I refer to
this condition as The APRS Black Hole!

     I have been working on getting stations in The Hudson Val-
ley interested in APRS, particularly in respect to someone set-
ting up a WIDE digipeater in order to extend the net into this
"black hole."  My problem has been that of stations firing up
the software, nobody appears on their screen after an hour or
two and they then wipe it off of their harddrive.  After all,
it's no fun seeing your station in the middle and nothing else.

     With any amount of luck your new WIDE will hear some of
the stations I've been trying to get going and DIGI them.  If
this works, we'll have the start of something to extend the
existing northeast corridor APRS net into the heartland of the
state.  I'm still going to be pushing to get another WIDE some-
place between White Plains and Schenectady to help fill in the
holes that will undoubtedly exist in this sometimes RF-hostile
region.  I've found that north-south paths are better than
east-west ones due to the lay of the land.

     Best of luck with your new DIGI.  I'll be looking for you
on the screen (when the band is open it might just work!)  73

Rendered body type: text/plain

```
There is some confusion about what I meant about the retranmitting of
data on packet for use of GPS DGPS data.

The way I read it... (which really means nothing)  is:
```

If I aquire DPGS data, and re-transmit it on packet, thats illegal.

If I generate DGPS data, not by simply getting it off a subcarrier, but by some other means (I dont really know how its done) that seems to be legal.

So, hooking up my subcarrier radio, reformatting it into packet I believe is illeagal.. I know it sounds like legalese, and perhaps (probably) I dont really understand it, but I think any one concerned should be AT LEAST aware of this possible conflict.

No, Im not trying to rain on a parade, nor discourage experimenting, nor be a book beater, more rightous than thou, but so far Im not convinced that anyone has really written a valid rebuttal yet. Im still open to trying to figure it out ! REALLY I AM ! I suppose some will say it is and some will say it isnt.; would hate to spend $$ and find out it aint allowed...

Six reservations have been received for the next run of the Blackjack GPS Antenna. We need a total of 25 reservations but will go into production as soon as there are 15. At this point we will have sufficient orders to cover the costs of the parts and outside tooling labor. For those that have reserved, please keep your eyes on the sig and I'll announce when to send the official order and $$$ in to us. We will also contact you by direct EMail....

I would also welcome a group purchase from anyones club or APRS group. There is a 10% group purchase discount for orders of 11 or more shipped to the same address and paid with one payment.

I am also exploring the possibility of starting an authorized dealer program if business warrants. Anyone interested in stocking the Blackjack as a dealer/distributor should contact me direct by EMail....

APRS Perseids Meteor Scatter Test Announcement

Date and Time: August 11 0000 UTC to August 12 1200 UTC
                 (August 10 2000 EDST to August 12 0800 EDST)

Frequency: 145.79 and 50.62 MHz (if available in your area)

Mode   1200 baud AX.25 packet

All amateurs are encouraged to participate in the Perseids meteor scatter test August 11-12. Although 6 meters is better than 2 meters for meteor scatter work, everyone has a 2-meter radio and we can make up in numbers what we lack in performance (during the 1995 test, numerous stations received packets from 600 to 1000 miles away and a handful even copied stations over 1000 miles away... on 2 meters). All you need is a TNC and, preferably, high power and a beam. The objective is to see how many grid square (DX) packets you can receive over the 36-hour event (a successful connection would be icing on the cake).

Stations in the four quadrants of the continent transmit alternately for 15 seconds (the quadrants are formed by the 39 degree north latitude and 96 degrees west longitude). There are two ways to do this: (1) by using the Meteor Scatter (MS) mode built into the DOS version of APRS or (2) by placing your six-digit grid square in the Unproto To call sign field, for example, WA1LOU>FN31MP.

Suggested procedures for the test follow:

1) Point your beam towards a major population area 500 to 1000 miles away in one of the other US quadrants. If there is another active local station, coordinate your beam headings so you are not both hitting the same azimuth and receiver target area.

2) Enter your grid square into your TNC using the following command:

```
cmd: UNPROTO FN31mp
```

where FN31mp is your six-digit grid square. If you can't estimate the last two digits, use aa. Note that no Via Digipeater is used.

3) For attended operation, enter the Converse Mode (cmd: CONV). Each time you hit carriage return <CR>, you send a packet. Hit 20 <CR>s and you send 20 grid square packets. Synchronize your clock with WWV and transmit as many packets that you can according to the following schedule:

Northeast stations transmit between 00 to 14 seconds of each minute.

Southeast stations transmit between 15 to 29 seconds of each minute.

Southwest stations transmit between 30 to 44 seconds of each minute.

Northwest stations transmit between 45 to 59 seconds of each minute

4) Alternatively, run APRS DOS version 7.1b or later. Its automated meteor scatter mode plots received packets on a map. (Read the file METEOR.TXT bundled with the latest releases of APRS.)

By the way, only stations running at least 100 watts into a beam antenna should transmit. Anything less is unlikely to propagate packets via meteor scatter and just causes unnecessary QRM. For example, during last year's test, I transmitted 150 watts into an 11-element beam and nobody reported receiving my packets!

Even if your station is not a powerhouse, you can still participate by monitoring the test. If you are running APRS, each received grid square packet is plotted on a map and entered into the APRS Heard log.

If you are not running APRS, set the clock in your TNC and enabling the time-stamping function so that each monitored packet displays the date and time of its reception. This makes logging received packets easy and permits unattended monitoring and logging when you are unable to sit in front of your computer. Watch for stations sending packets containing grid squares. Make a note of the grid squares that are 500 to 1200 miles from your QTH. When you receive a grid square from one of those, you know you have hit pay dirt. If you are running 100 watts or more into a beam antenna, you can try and make a connection with that station, too!

After the test, I will need your reports to see how we did. Your reports should contain the following information:

Your call sign

Your state/province

Your grid square

Your effective radiated power

Call signs of received/connected stations

Grid squares of received/connected stations

Time of reception/connection in UTC and number of received packets

Distance between you and the received/connected stations

Send your reports by email to:

stanzepa@nai.net

Or by mail to:

Stan Horzepa, WA1LOU
One Glen Ave.
Wolcott, CT 06716-1442

Have fun!

175. Com ports and APRS?

Hello All,

I am new to APRS and am trying to get ver 7.4 running. My TNC is on comm 4 IRQ9 and I cannot get APRS to recognize the TNC. Does it not work with non-standard comm ports and IRQ's? If it will, how do I configure it? Thanks.

Dave KD6TO

Was the map name   LA.HQX  (you said it was  la.htq)

If so, you need to decompress it with the SIT.exe program (i don't remember
the exact name)..

I encourage the growth of "cottage industries", including that of GPS patch antennas and even doppler DF units, but I'm wondering if maybe it is time for a special web page/email address for the orders, confirmations, production run announcements, etc.

An announcement here when something significant is announced is appreciated, but then the replies and back and forth stuff begin- each one quoting the previous message/announcement, etc.

Before you flame.... Notice that I said that I want to see these industries grow, including the announcements, but folks please: watch the reply button. that is probably what generates most of the traffic.

Well i sooner see it here then it being send by APRS bullitens, like i have seen in the B list. People advertizing their web pages etc, specially coming way from down South East Florida. I won't go any further then that, but there's more of the same. I realy don't see anything wrong with it. Like many have told me Hit The Delete Button for those that don't like it. And this is not a flame just my opinion!.

By the way i chatted with Bob Bruninga after i seen him popup on my map here in North Alabama, he had a heck of a time getting an antenna setup finally went to Radio Shack and got some coax and used a couple of fishing poles to get (Get this) a CB antenna up before he started seeing people pop up on his map. After pointing my beams at him (64 miles away) i could chat with him direct. He's in Florence,AL at visiting Family.

As the most recent generator of the "business ads", I MUST (out of respect to EVERYBODY) say that an announcement is fine but replies need to be directed to the ORIGINATOR as opposed to posting to the SIG. Please, everyone, in the future when replying to my postings, use a direct EMail and don't simply ignore the TO field! Remember: On this SIG the "Reply To:" field is always set to APRSSIG@TAPR.ORG. It is NOT the ORIGINATOR.

Further, not just in these types of replies, but in ALL replies, it just isn't really necessary to quote an entire message. In some cases it IS desirable to include snips but the full text is rarely necessary...

Thanks!

APRS aficionados,

Quick history: A couple months ago my boss bought himself one of those nifty HP palmtop PCs to use for his schedule, notes, etc. He loves it and has extolled the virtues of it so much that when I asked for one he couldn't get off by telling me "No."

"So what?" you say... Well I have another agenda (pun intended...) for my 200XL! Driven to temptation by the occasional message I see on the SIG, I intend to run APRS on mine!

Any of you that have attempted and/or been successful, please lend me a hand! You have empirical knowledge I lack and can benefit from! Send any and all comments, suggestions, and instructions so that I may profit from your unsurpassed wisdom! (Gee, I may be laying it on too thick, but you can probably tell I'm asking for help...)

The unit I've obtained is a new Hewlett Packard 200LX with 2MB of RAM. What do I need, H/W and S/W wise, to make this work? I can get the "Connectivity Kit" for $72.50, or just the serial cable for $18.00. In addition, I have a very kind brother-in-law that works for a major Silicon Valley firm who's giving me at least one, maybe two, 16MB flash-RAM PCMCIA card. (Think of the maps I could keep on the little beastie...) What, if any, software will I need to make that work?

Any and all help appreciated! If this goes well. I hope to
write up an "HP200LX.TXT" file for Bob to consider adding to
the APRS docs...

Bill and All:
I have sucessfully been running APRS on my 200LX for about six
months now. All you need is the serial cable and a standard pc card
flashcard. The software to support the card is standard on the HP. I
copied the software the the flashcard from my laptop, popped it in the
HP, edited autoexec.bat to run APRS instead of 200 (the HP front end)
and away it went. A little slow on map redraws, but very useable.

hi there, mike here in foster city, ca. i've been running aprs with my hp
100lx 2mb palmtop in my work truck for quite some time. i bought the
connectivity cable and the 4 adapters to connect to another computer,
printer, modem, etc. i use the serial adapter to connect to the tnc and it
works fine. the only thing i have to do on mine and you may or may not have
to do, is close all applications in order to provide the palmtop with all its
memory allocated for the running application. the instruction book for the

palmtop explains how to do this. other than that, it works great! almost
better than a laptop because the palmtop display likes bright light!
 anyways, i run the palmtop with a kpc-3, garmin 45 gps, and radio shack
htx-202 with a paccom hsp y-cable.
hope to "see" you on aprs soon!

Patrick and the group,

I guess we can run a "short" thread on the SIG, there may be
other poor souls interested in the same thing.<g>  Patrick,
could I ask a "few" specific questions?

What APRS revision are you running?
        I've pretty much standardized on 7.6f.  OK?
What (if any) recommendations for files/dirs in/excluded?
        Follow Bob's recommended minimum setup?
How much RAM does your 200LX have?
        Should/could I copy the program to internal RAM?
What size flash RAM card are you using?
        Do you ever switch cards to changes maps?
What kind of battery are you using?
        Alkaline or NiCd?
What kind of battery life are you getting?
Does the unit ever try to "power down" running APRS?

Your last post was *VERY* encouraging!  I want you to know
you're one of the people that's to blame for this wild fancy
I'm pursuing, so I appreciate your input!

191. Latest javAPRS News

From: Steve Dimse <sdimse@bridge.net>
Date: Sun, 11 Aug 96 17:00:45 -0400
To: <aprssig@tapr.org>
Message-ID: <199608112057.QAA18104@bridge.net>
Rendered body type: text/plain

I have posted a new version of javAPRS (0.4b1) to the tapr site, and can
also be seen at WA4DSY's site. Aside from fixing a few nagging i/o bugs,
the biggest improvement is the ability to correctly parse and display
incoming hurricane and weather packets. Clicking on a weather station on
the map will show the last data from that station. The data is also
displayed on the station list.

To check it out, see the Bertha replay at:

   http://www.bridge.net/~sdimse/hurricane.html

(This data is stolen from Bob, WB4APR, because it is so much better than
the data I was using to demo hurricane tracking.)

If you haven't seen Bob's site yet, there are lots of other cool demos
and live HF and VHF data. (He isn't using 0.4 yet, but I suspect it will
be up tomorrow.)

   http://web.usna.navy.mil/~bruninga/aprs.html

The 3.0b7 beta of Netscape Navigator for the Mac has just come out, and
is a great improvement in Java support. In particular, the initial
startup of javAPRS is almost three times as fast, and the java classes
are correctly cached, so moving from one page to another takes a couple
of seconds. Are the Windows versions showing similar improvements?

Dale, WA4DSY, has found and fixed the intermittant crashing bug in his
live data server. It also is now caching a bunch of data, so when you
first log on you get a bunch of posits all at once, and then live data
begins. Very nice!

   http://www.wa4dsy.radio.org/aprs

Enjoy de Steve KO4HD

APRS works fine on my HPLX-100. I put the whole thing on
a flash card. You must run it in native DOS and not from
the application manager. Do [More] then [menu] [application]
[terminate all]. You must have one of HP's serial cables
which translate their small connector to regular 9 pin
RS232. Also, you need a $3 null modem adapter from Radio
Shack. Then you're in business. The aspect ratio on the maps
is a little squished but readable. And the maps take a while
to load.

Cheersd,
Bob Kirk

Rendered body type: text/plain

Have been using my Garmin 45 in the car utilizing an outside antenna. Worked fine until recently. The unit now will not acquire any of the satellite signals and will shut off after 5 minutes or so. Tried new batteries and the portable antenna that came with it and no luck. Any thoughts regarding this would be helpful before I attempt to call Garmin. I see no place for a reset on the GPS. I did clear the track logging because it said all the memory was used up. Thank you.

Did you WEATHERPROOF the antenna? If the antenna gets shorted there is the possibility of damage to the receiver since it supplies power to an active antenna through the antenna cable! Most likely this is the cause, unfortunately... Good luck with getting it fixed though...

Hi Cardwell

You have an old Mic Switchf from MFJ. Take it back to your dealer and ask for one that has a Version 9 board in it. You likely have a version 7.

Hope this helps...mike

It was interesting to see how the recent M Scatt. test worked in Florida.
Almost NO ONE disabled their digi paths, gates etc.
I tried on Sat. evening but after a number of phone calls telling me that
my station was broken or operating illegal I gave it up.
I posted a bullet on on aprs and copied the Test Announcement by WA1LOU
to the local BBS but I guess Hams in Florida can't read or don't care.
It is amazing how many people will operate a system or program without
knowing what they are doing. The old add age "WHEN ALL ELSE FAILS, READ
THE DIRECTIONS" sure holds true in Florida.

The asbestos suit is in place and the fire extinguishers are ready!!!

Bud (WB4LTF)

> melded during typing...

Happens sometimes! I've had that happen frequently when addressing the SIG...

> I think Bob has already tried the above method and it suffers from the
> things you point out here.

Indeed. Although this *IS* the 2ndary correction I use to get to submeter accuracy with the cows. But here I have all receivers with the same firmware and programming, in a relatively unrestricted access region for the sky, and started all about the same time, within 10 minutes of each other and allowed to acquire and go on. Makes a big difference.

> The better solution is to find a way to code or encapsulate the RTCM
> binary data and use the digipeater to transmit it to the users. Then
> APRS (or other software) can decode it and send it on to the GPS. I see
> you have been working on the coding, there must be a way...Is the RTCM a
> contant stream or could it be broken up into packets?

```
I use a Tiny-2 Mk2, in transparent mode, 8 bits, packtime AFTER 5, and
granularity set to 15 seconds.  For the Cows project that works just fine.
Granularity bet beyond 30 seconds dilutes the correction accuracy
significantly by requiring too many interpolations and too much error
propagation for my comfort.

It *IS* a fairly short packet, 256 bytes every 15 sec.  Oh, and it should NOT
be set to "RELAY,WIDE,WIDE" as you only want the data propagated around the
fairly local area you're in with the base station.  I'd think a "RELAY WIDE"
at most, or maybe just "WIDE" would suffice.

Well, we finally saw WB0WNX-7 Air Mobile this evening beginning about 2330
CDT....Sending $GPRMC strings only.  Received following one time:

/120426z3946.12N/09454.37W'360/96./raw*/good RMC fix

Saw several repeats of this same data over the course of the last 15-20 minutes.
 I suspect that he is/was either taxiing at Rosecrans or his GPS shut down at
the 99 knot limit!

Since he's a pilot, though, I'd bet he's not running a GPS-45!!!

Anyway, at least his tracker IS working to a point as far as I can see....

We'll look forward to hearing from him when he lands at SUX...

BTW:  What's the chances of having that Air Mobile down here in Kansas City area
over the weekend of Sept. 7-8?  It would make a GREAT airborne APRS command post
for the MS-150 Bike Ride (not to mention the PERFECT digipeater) crusing along
at about Angels-10...  (UZQ are you getting this????  Would this be WAY cool, or
what!)

```
If you had a 1/4 amp fuse in the power feed you were ok.

try
1. enter your Lon/lot/ alt and time via the keys
2. Force a search the sky mode
3. remove all power and batteries for a day or so
   to reset.
4. Check the Secret Diag mode which I think also does a reset
   see the Garmin-45 Faq
----------
Diagnostics mode:
  To get into this mode, quickly after turning on the power (while the globe
  is still spinning), press all 4 arrows one at a time (in any order).

  2 or 3 digit numbers are added to many screens.  Reportedly they are the
  process stack depth.                                                 |

  The signal strength bars are initially hollow. They become solid apparently
  when some specific data has been downloaded from the satellite.

  The number in the bottom right of the satellite screen (usually something
  like 1.3 or 4.2), looks like an indication of the geometric degradation of
  [precision] (GDOP).  It varies with the number and location of satellites
  being received, being lowest when a group of satellites scattered widely over
  the sky are present, and highest for a cluster of satellites, or when the
  received satellites are all in a straight line.  It also seems to vary in
  step with the "accuracy" number normally displayed in the top right.
  Contributed by proach@cais2.cais.com (Peter Roach)

  The internal temperature in degrees Fahrenheit is added to the position
  screen to the right of the time.

  A "DIAG" option is added at the bottom of the menu screen.  The following
  is displayed on the DIAG screen:

    Battery voltage in hundredths of volts.
    Elapsed time (can be zeroed by pressing ENTER).
    Screen can be paused by pressing MARK.
    Looks like there is a lot of internal software debugging info.

Rendered body type: text/plain

Sorry if this has already been answered many times, but I've been away for a while...

If the battery life for the Garmin-45 is "10 to 20 hours" with the standard antenna which comes with it, what can be expected if one uses that active Trimble antenna sold by PacComm?

Second question: A while back there was a debate (here?) that the active Trimble antenna actually caused damage to the Garmin-45 if operated for extended periods of time. It seems to me this debate finally concluded that it wasn't really true. Any developments since then?

I have been running APRS on my 200LX for months with no problem. I only have the standard 2Mb installed so I keep the number of maps to a minimum. I built a GPS tracker with the HSP circuit. I connect my tracker to the 200LX with the $18 serial cable and I'm online.

I had a great time using it this past weekend to watch/chase the BLT-12 balloon launch from Wharton, Texas. Too bad APRS doesn't do 3D predictions on where the balloon will land based on the RMC strings and the change in altitude. It did work rather well....I was able to drive right under it and watch it land in a cotton field.

Author:  aprssig@tapr.org at INTERNET_MAIL
Date:    8/11/96 9:16 AM
```

APRS aficionados,

Quick history: A couple months ago my boss bought himself one of those nifty HP palmtop PCs to use for his schedule, notes, etc. He loves it and has extolled the virtues of it so much that when I asked for one he couldn't get off by telling me "No."

"So what?" you say... Well I have another agenda (pun
intended...) for my 200XL! Driven to temptation by the
occasional message I see on the SIG, I intend to run APRS on
mine!

Any of you that have attempted and/or been successful,
please lend me a hand! You have empirical knowledge I lack
and can benefit from! Send any and all comments,
suggestions, and instructions so that I may profit from your
unsurpassed wisdom! (Gee, I may be laying it on too thick,
but you can probably tell I'm asking for help...)

The unit I've obtained is a new Hewlett Packard 200LX with
2MB of RAM. What do I need, H/W and S/W wise, to make this
work? I can get the "Connectivity Kit" for $72.50, or just
the serial cable for $18.00. In addition, I have a very
kind brother-in-law that works for a major Silicon Valley
firm who's giving me at least one, maybe two, 16MB flash-RAM
PCMCIA card. (Think of the maps I could keep on the little
beastie...) What, if any, software will I need to make that
work?

Any and all help appreciated! If this goes well. I hope to
write up an "HP200LX.TXT" file for Bob to consider adding to
the APRS docs...

210. Richmond, VA, is an APRS black hole

From: w4wwq@juno.com
Date: Mon, 12 Aug 1996 11:37:35 PST
To: aprssig@tapr.org
Cc: hhassell@i2020.net
Message-ID: <19960812.113741.22887.0.W4WWQ@juno.com>
Rendered body type: text/plain

Bob Bruninga wanted information about this BLACK HOLE.

145.790 is already active in Richmond by a BBS devoted to TCP/IP. The
call sign is K4ZIV.

The Virginia State EOC at Richmond (and with a 300' tower) call sign is
W4ZA. The trustee is K4YEF.

A "digital" contact might be Bob Smith, WA4YPV. (He may have e-mail at
BOBSMITH@i2020.net)

My source of information is Henry Hassell, K4LMY, e-mail
HHASSELL@i2020.net.
Henry has APRS software but due to other business interests and the lack
of activity in the Richmond area he hasn't been able to "push a chain"
so to speak. He wasn't able to be the catalyst to make APRS happen in
the Richmond area.

For long term planning, on the 2nd or 3rd weekend of January each year
the Richmond club (R.A.T.S.) sponsors FROST FEST, a well attended ham
fest.

Pete
Forest, VA

211. Running APRS on HP200LX

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 12 Aug 96 11:50:33 EDT
To: <aprssig@tapr.org>
Message-ID: <960812155033_71301.3106_FHJ64-1@CompuServe.COM>
Rendered body type: text/plain

Bill -

I run 7.6f on a 200 with 1MB internal and a 5MB flashcard, attached to a
home-brew HSP adapter for serial port sharing. I spent a very intense two weeks
running APRS mobile this way late last winter.

Adding to and amplifying some of the other's comments:

```
1) Flash card - you'll need one. It may be possible to squeeze a
super-minimized APRS system into drive C: on a 2MB 200, but I think it'd be a
constant struggle. If you go for a non-HP flashcard (there *are* bargains to be
had), you need to be sure it is "ATA-compatible". There are a lot of non-ATA
flashcards out there and they will not work in the HP.

2) Not only is map drawing slow, maps have to be redrawn every time you display
a bulletin list or other non-map display. My edu-guess is that this is because
of running in CGA mode, and there is no video display paging like you'd get
with VGA. This exacerbates the slow map draw problem, and tends to increase the
teeth-grit factor of pressing the wrong key.

3) Commercially-built HSP adapters *may* not work out of the box. I was unable
to get my HSP to work until the line-level biasing was removed. Be sure to
fully read the HSP documentation in "\README\GPS.TXT".

4) I recommend using the full Connectivity Kit. Not only do you get the cable
and an assortment of very useful adapters, the special LapLink software makes
transferring files between your PC and the 200 very easy. I run a "full blown"
APRS (help files and all) on my 200, and it's primarily because LapLink made
file transfers effortless.

5) Unfortunately, you must run APRS out of DOS. While .EXE files can be
configured to run from the 200's "Program Manager", there is not enough CPU
memory space to do it. You will have to "ALT-A, T" from the Program Manager.
Which reminds me...

6) Be *very* careful about adding TSR's. APRS takes a lot of space, and since
there is no "high memory" like you may be accustomed to on a usual DOS box,
that 640K of base memory is very precious. One or two TSR's and APRS might not
load.

7) A couple of 3rd-party mods are available for the 200 - an internal 5MB
option, and a double-speed CPU clock. The 5MB mod might be nice, but it's
roughly double the price of a flashcard. The double-speed mod is about $60, and
may be something I might just try. Either will void the warranty, however, and
there has been some talk that HP won't even repair 200's with the double-speed
mod.

8) Don't even think about the PCMCIA GPS cards. They take way too much current
for the 200's feeble card port.

9) The 200's internal power supply is very RF noisy. I had mine plugged into
the filtered power subsystem in my "mobile shack", and it took about three days
before I realized that all that funny sounding interference on three out of
four radios was the HP. No amount of filtering - chokes, ferrites, bypass caps
- would deal with it. If I ran it on batteries, no problem, so it's been on
batteries ever since.

10) I run alkalines, for their longer running life and longer shelf life.
During the trip I'd get about 2 days on a pair. The consumption problem is from
constantly powering the serial port, because otherwise the 200 is very miserly
with power.

11) After also being concerned about the auto power-off, I discovered that APRS
somehow (tho' probably not intentionally) disables this. Just don't start APRS
for grins and then forget it, because you'll kill the batteries fast (see #10).

12) A "classic" 200 problem is weak hinges. You won't see this for several
months, but with even irregular use, before it's a year old the display half
will start getting pretty floppy. I'm fabricating a simple support stand for my
heads-up display situation because it's starting to fall over when hitting
bumps.

The 200LX is certainly a usable - albeit not the best - configuration for APRS.
My biggest gripe, aside from slow map draws, is that with APRS's reliance on
color for line feature distinction, sometimes maps are a useless jumble of
lines. This makes complex maps a double-whammy: slow *and* hard to read.

But all in all, I think you'll enjoy it. It's fun, a little different, and the
"ultimate portability" certainly has utility.

On the FM subcarrier, we use between 37 and 50 bits per second.  I am
surprised just how little traffic there is over APRS here in the bay area
(145.01).  Is this not the case elsewhere.
One thing that dis surprise and disturb me was the delay in the network.  T
tried transmitting character test messages every 10 seconds, and foung up to
30 second delays in turnaround time.  Is this typical??

I haven't tested it, but wouldn't expect a major difference, since the Trimble circuitry
is a preamp and not likely to draw much current.

> Second question:  A while back there was a debate (here?) that the

Have been using the Trimble antenna with GPS-45 for over four months and have not
noticed any problems with operation of the Garmin.  I usually operate with external DC
to the GPS-45, but it appears to work fine with battery power, too.

Shannon-

The Motorola antennas draw about 25 ma, and I'd be surprised if the trimbles
drew much less.  I can tell a difference in batt life with the moto.  It
works fine on battery though.

NON APRS  anouncment!!,

   But how many of us Hams can refuse a free service like this.

    Free email for anyone with a PC runing Windows. This is really
free, a completley free internet service by Juno. Included is free
Juno, Windows email software (has a great spell check built in).
So who pays for this service??? Advertisements pay ...just like for
over the air TV. When you download your mail through the toll free
```

numbers provided, you also down load some advertisments. These
advertisements are very un invading, commercials for grape juice,
sports service, internet stuff....nice little pictures that don`t get
in your way.

    To get the free software disk ;

call   1-800-654-5866

or email signup@juno.com
send them your complete postal address

Great for anyone that just wants free email, or a second email
account.

220. Interim report on using HP200LX for APRS

From: byoung@qni.com
Date: Mon, 12 Aug 1996 18:22:08 -0500
To: aprssig@tapr.org
Message-ID: <9608122322.AA09589@qni.com>
Rendered body type: text/plain

Fellow Friends of APRS,

I've had some *FANTASTIC* feedback on running APRS on a Hewlett
Packard 200LX Palmtop PC! There are some skilled folks out there
"pushing the envelope" for the sake of amateur radio, APRS, and fun!

I would like to thank:

Mike Musick, N0QBF; George Dean, KC5KGE; Mike, AC6JA; Patrick Voigt,
KD4GCM; Dave Rice, KD4SHH; and Bob Kirk N3OZB.

My "free" PCMCIA memory card is due within a few days, and since I had
several recommendations to run from one, I'll wait (excitedly!) till
it arrives. I've also ordered the whole "Connectivity Pack" (serial
cable, adapters, LapLink software...). It'll help with APRS *AND*
assist in all the other mundane tasks you *SHOULD* use the device for.

I plan on "editing" all the notes and, giving credit to all who
contributed, then provide the "application note" to the APRS
community.

Hi Paul,
 Welcome to the World of APRS, I hope you enjoy it. Just a quick note for
you. You may want to use or learn to use the ability to reply in message to
the sender. I am not the original sender. I, as well as everyone else on the
APRS sig received this message. In otherwords, your message "REPLY" went to
the sig and not directly to the person you intended. You will probably need
to cut and paste the name of who you want to reply to. If you just enter
reply when reading a message on the sig, eveyone sees it.
 I hope this helps, and again, welcome to the sig.

     >seconds, and foung up to 30 second delays in turnaround time.
     >Is this typical??

     How long is your digi path?

     If you're sending a path all the way down to the digi in
     the Crestline area(San Bernadino Mtns) it could easily
     be that long.

     If it's a short digi path, Maybe it's some traffic that
     your high level digi is seeing that you're not.
     (just a guess)

>E-mail Jeff.Ruhnke@MWBBS.COM

Hi Jeff,
  I too am a member of NIAN, not on the board though. I live in Rockford.
Paul, WA9FFL and I were talking today. I noticed the "NOTE" on APRS that
NIAN has DFjr's for sale. This is the first that I had heard that NIAN was
or had planned to purchase DFjr's. I had ordered one for Agrelo myself.
WA9FFL recently received his. Since I have seen no e-mail communication from
NIAN in over 2 months this came as a surprise. We may have ordered them thru
the group had we known. 2 members displayed one at the Rockford Hamfest, and
told us they were ordered already. I beleive they were ordered before Paul
and I ordered ours.
```

I'll be a bit polite when I question how NIAN could afford a quantity purchase to sell DFjr's in Chicago when it could'nt afford to help WA9CJN to my knowledge.
NIAN was extremely cash poor to the last of my knowledge at meetings. Since I've not been notified of any meetings, thus have not been able to attend such, or received a e-mail of minutes, etc, it's hard to know whether or not there has been a major influx of new members to sustain such a group purchase with funds up front. But in all actuallity, I suspect an enterprising member that is monetarily comfortable has bank-rolled this and is sharing the profit/risk with NIAN. In either case, as a member of NIAN, it would have been nice to have some advance knowledge. I might not have been so inclined to contact Agrelo directly.

We're wanting to purchase a TNC to use at an antenna site that's available to us. Our host has volunteered a place fairly high up on a tower and the use of a radio for APRS. Its available for the price of a TNC. I dunno, whats a DIGI up 300ft on Rockford worth to NIAN. Maybe not much if we as members,are not even kept informed as to club activities.

Rogers essentially free digi in Rockford would be a great thing and I'm glad somebody is willing to support APRS....

BUT......

Did a semi-flame message HAVE to go out to the SIG? If we're going to have in-fighting (if that's what this is) in our little groups then...

1) Keep it within your own group and off the SIG...
2) Try to remember that the guy/gal at the other end of the keys IS a person...
3) As long as we're fighting, remember NOTHING IS GETTING DONE!!!

IMHO: TNCs are dirt cheap....Kantronics KPC-3 can be had for as low as $99.00
on sale, even at the regular $119 they're still readily affordable. (I'd go in
for fourths with three of my other users if it meant a new digi site!)

> IMHO: TNCs are dirt cheap....Kantronics KPC-3 can be had for as low as $99.00
> on sale, even at the regular $119 they're still readily affordable.

The real TNC2 clones (MFJ-1270 and such) may really be a better
"investment". Sure, they're a bit bigger, and about the same pricew
($119), but they do use "real" TAPR ROMs (ongoing firmware upgrades),
and have 9600 baud capability.

Don't get me wrong.. the KPC-3 is a good unit, comparable with the
others in its price range. Just be aware of its limitations; unless
Kantronics made MAJOR hardware changes in the unit, it's NOT possible to
use them at anything other than 1200 baud.

I take it, with the limited detail, according to my files, there is no detailed information in map form for Montana, so I must assume there is no other activity in the state. If there is activity, let me know, so that we may get in touch via personal E-Mail exchange.... If I even get someone out of state, I would be more than glad to get in touch with you.

Not much to ask of anyone, just want to grow and learn about APRS, as I recently got into APRS about a year ago, and signed up with the SIG a week ago. Been reading some of the SIG, and learning as I go along.

Sorry I didn't put grid-DN78 on the air, was away from the computers over the MS weekend.... Maybe next year I'll fire up the 6-element beam and 50 watts for the next M-scatter test.

I realise that this is not an APRS subject but I would like to respond to
Bill's statements...
Many amateurs are equipment poor but with Juno, if they have a computer
and a modem
they have email.  Many of the amateurs here are getting on email...that
makes my job so much
easier. Juno email goes to any address world wide...they provide good
service...they are
responsive to their members...they have developed a good
product...provide free access
lines and the service is underwritten by their sponsors.  They are
concerned about the
privacy of their members and as to the charge that they sell
address....don't know if they
do but if you have a credit card, order anything from a catalogue, or
have an account any
where your address gets sold...for more information JUNO is on line at:
http://www.juno.com.  I use Juno to send hurricane advisories, district
information, net
rosters, and other information.  It gets there faster and I don't have to
spend megabucks on
postage.  I invite you to check it out.

Linda  AD4BL

my previous message was not intended to go out to the sig. I either mis-addressed the reply (a couple of them in a row???) or the sig mailer might not have handled it correctly. I did receive some strange non-deliverable message replies to a wings.com which I know I didnt send any messages to.

In either event, my apologies to the sig. End of bandwidth.

APRSdos REPLY/COMMENT: I believe we assume too much from this SIG.. We have now had TWO space shuttle SAREX's authorized for APRS, and yet fewer than 60 stations tried... It is tempting to believe that exciting APRS things posted here get out to all the world, but I now think the 10% rule applies. I think we have too much traffic and so many dont read most of it. hi hi. I dont blame them...

BUT, It is incumbent on all SIG members here, to ANNOUUNCE via their local APRS BLNS that an event is comming. If you dont announce it on your local VHF net in advance, then you will be the only 1% that knows about it...

254. WX station bug?

From: Richard Amirault <amirault@laraby.tiac.net>
Date: Tue, 13 Aug 1996 18:16:42 -0400 (EDT)
To: APRS sig group <aprssig@tapr.org>
Message-ID: <Pine.BSF.3.91.960813180031.7374A-100000@laraby.tiac.net>
Rendered body type: text/plain

```
Bob,

A week or so ago I posted a msg regarding the way APRS reads and stores
the rain gauge data. You posted the answer to *that* question. Thank you.

In my ogiginal post, I mentioned that I did not think my station was
acting acording to the WX docs. But I didn't feel like climbing up to the
rain gauge on the roof to trip the gauge, so I waited 'till it rained.

Now I'm sure .... it does not act like the docs say it should.

Today we had enough rain to trip my .1 in gauge in the morning. This
afternoon, I sat down at my computer and checked my Pos report. It was as
expected (R000,P010). I went to the P screen within APRS. I then reached
over to the Ultimeter II and checked the rain data. It read .1 in. (the
down arrow //daily// screen, not the up arrow //monthly// screen)

I then *cleared* the rain guage screen, and watched what happened on my
APRS screen....

The next time APRS said "Getting WX station data" my Pos report WX (rain)
data went to all periods!  (R...,P...) as if I didn't have a rain gauge
connected at all. This condition continued only until the next "Getting
WX station data" when the periods were replace with all zeros (R000,P000)

I don't think it should be acting this way. As the only APRS WX station
in Eastern Massachusetts I'd like to be transmitting valid data. Now the
next thing to try is to let it trip again, and this time *not* clear the
Ultimeter II, and see how long APRS keeps the data. (but I don't know how
long till it rains again)

Richard Amirault              N1JDU           Boston, Massachusetts USA

Roger,
NIAN didn't buy the DFjrs, Dan N9XHP did, ordering 10 two months ago. They
were bought and paid for (10 at 300 ea=$3000) at that time and he just now
got the first 5 in.
We are using most of them for Marine Safety on Lake MI with the USCGAUX but
thought that we would make two or three avabile for sale to someone who may
wish to try out DFing.
I to am puzzled by the lack of activity, I have no idea where NIAN went to,
and my calls are not returned and quite frankly it is disturbing to me as I
started up APRS activity in the metro area.
After 7 years in the Army, 18 as a street cop and 6 in an executive
governmental position I've learned that sometimes peoples egos get in the
way, this is a hobby, it's suposed to be fun.
Maybe it is time to step back and let the folks who need to get a life play
for awhile. >

257. KU0G and Karla Mobile APRS Weekend!!!

From: ku0g@sprynet.com
Date: Tue, 13 Aug 1996 18:57:30 -0700
To: aprssig@tapr.org
Message-ID: <199608140157.SAA01839@m1.sprynet.com>
Rendered body type: text/plain

```
OKAY, EVERYBODY.....

Major Mobile Operation about to commence here....

Karla and I are headed for Chicagoland over Labor Day Weekend.  We were
originally going to go by train but now are planning a car trip.  This means
that I get to use real antennas for the APRS Mobile operation!

We will operate a live station on the way beginning Friday evening, Aug. 30.  We
will be traveling the following route:

I-35 north from Kansas City to US 36 East to Springfield, IL with a diversion up
to Jacksonville, IL, for dinner in the old Alton Depot.  We will most likely try
to drive on into Elgin, IL (where we are moteled) Friday night late.  On
Saturday we plan on driving over to Union, IL, to the Illinois Railroad Museum
and ride trains and streetcars for the biggest part of the day.

Saturday evening will find us RAILROAD MOBILE with stand-alone tracker on the
commuter trains when we travel downtown to the North Shore for dinner, etc. and
return.

Same thing Sunday except we will be working our way through the Shedd Aquarium
and the various museums on the south shore.

We will start our return trip to Kansas City early Monday morning with our
INTENDED route being I-80 west through Quad Cities and Des Moines then south on
I-35 back to Kansas City.  We will most likely do considerable wandering Monday
during the daylight hours.

We will alternate Unproto paths on the live station using:

RELAY,WIDE,WIDE
RELAY,WIDE,GATE,GATE
WIDE,WIDE
WIDE,GATE,GATE

Our tracker unit will be KU0G-15 and its path is always set to RELAY,WIDE,WIDE.

Please watch for us and if you are kind enough to turn LOGGING ON and save track
histories, we will appreciate your sending them to us!  We are also looking
forward to eyeballing as many APRS users as we can over the weekend so if we're
close, give us a call on APRS messaging and give us a voice repeater frequency
to come up on!  By default, we will monitor 146.79 MHz Voice (simplex and
offset).

Should our travel plans change and we opt to return to Amtrak, watch for us as a
train icon and beaconing "From On Board Amtraks Southwest Chief!"

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

Have any of you seen the new FCC rules regarding RF
exposure limits as they apply to the amateur radio service?   The new rules
are quite disturbing...It looks to me like practically anyone can shut you
down if you are running more than 50 watts pep.  The new rules require an
"exposure evaluation" if the transmitter output EIRP exceeds 50 watts...what
a crock!  These rules go into effect Jan. 1, 1997.   Does the ARRL know anything
about this??
Steve, KG0DW.

APRSdos REPLY/COMMENT:  Dont do that! hi hi.  When you cleared the WX
station, how was APRS to know that?  In fact, how was anyone on your net
to know that you zeroed your rain counters?  That is why APRS reports only
changes in rain counts.  AND therefore why if you change your rain counter
(by zeroing it) you should expect to get a bad reading...

```
I will be operating 24 hours now on 14.100 LSB. We have several 30 meter
gates that have come up within 1 hop of me. Lets try and see (AGAIN (sigh)
 if someone will come up on 20 Meters. I am using the loop
so be patient !!

261. Meteor Scatter Test - "READ THE DIRECTIONS"

Subject: Meteor Scatter Test - "READ THE DIRECTIONS"

Bud, WB4LTF, has an interesting point when he states:

 "I posted a bulletin on aprs and copied the Test Announcement by WA1LOU
  to the local BBS but I guess Hams in Florida can't read or don't care."

There are many new users on the air who were unable to access the packet
station bulletin board Bud was referring to.  As everyone knows, it takes
knowledge of the packet station, where to aim one's antenna to reach it,
and having the right tools, such as a communication package to operate
a TNC.  There are no written rules that state an APRS operator must also
have regular packet communication capability, or be signed up on E-mail
SIG to receive the lengthy directions of a "Meteor Scatter Test".

Some APRS users were upset when they were told not to use the local DIGI
during the test period.  Only a few had the 100 watt or more capability
for achieving a signal bounce, thus most felt excluded from participating.
I personally, chose to stay off the air, so as to increase the chances
of a properly equipped station to have the frequency.  I know of one other
ham who did the same.  There were also others who were wanted to use APRS
in a more conventional manner.

New users are told immediately not to RELAY, to set their station to
UNPROTO to the local DIGI station.  For the Meteor Bounce Test, the same
users were told not to use the DIGI.  Complexities in setting up to
participate was more than they could handle, and some became quite
frustrated without explicite instructions.  I spoke to one individual
who could not understand why the test was not conducted on an alternate
APRS frequency, free of DIGIS.
```

Learning APRS is a task in itself. We, as a community, are trying to encourage others to get familiar with it, and use it. At the same time we are also trying to dictate a number of rules that most do not understand or have any motivation to follow. It appears to me that the "Meteor Scatter Test" and complex exercises like it, may actually have a reverse effect to alienate users if they do not have the education or means to discover what it all about.

>
> There's no such thing as FREE!.

Juno is free... How? Here is how they do it.

When you are getting your mail from the JUNO Central computer, the central computer will also send images of various products or services, much like a TV commercial, or better yet a roadside billboard. If you want more information on that product, you click on the image and more details are given. Since JUNO has advertising, and just like TV, radio, or newspaper, this advertising pays JUNO's bills, and since JUNO is getting paid by the advertiser, they have no need to ask for more money from their online customers. So, in essence, the online customer, like myself, does not give JUNO my credit card number, checking account number, or any other number, even Social Security... This is called _privacy_. As long as you have Windows and a PC, with a 9600 baud or faster modem, you can access JUNO.

> There we go it's not FREE, they sell your address and also send to you

The only information that you give them is your area code, so that when you are setting up your account, offline, the software will give you a choice of local access numbers to use to call into JUNO's central computer. If there is no local number to use, then there is the option of using an 800 number that they have set up for the areas that currently don't have a local number to call. This will change, since they are adding more local numbers as time goes on. Then you also set up what you want to use for a user name, since '@JUNO.COM' is already given to you. Once you have finished setting up your account, then your computer dials up a number already programmed in the software to call, and uploads the user defined information to the central computer at JUNO, and you will get a confirmation in a matter of seconds, and you are ready for sending E-Mail.

> No thanks, and your wrong it's not free!.

If you don't use it, then you don't know.

```

I gotta give credit where credit's due...

were it not for Dave KA9NHL and Ed N9LCI, I wouldn't have gotten hooked on APRS, and all the great things that the program offers.

I, too, have been baffled as to where NIAN went, and why it seems to have been taken over by Chicago, and stifled.

It seemed to be such a great concept: early WX warning from lessons learned from the Plainfield tornado. And NIAN was supposed to be the body for APRS/Multi-County Severe Storm Warning System. Oh, well...maybe WA9CJN wide can still help. It's there for the ones who want to use it.

>   wa4ikq@nevets.oau.org

First, NO ONE was told they couldn't use the digi. The Bulletin stated, " It is requested that users
set their
Unproto path to None during this test".

Geoffrey does make an interesting point when he states that many users on APRS have never used the TNC
for any
other purpose. This is true. Many have bought the TNC, hooked it up, turned it on, and started (or
tried to
start) APRS.   This may very well be why so many have trouble getting APRS to run, since their TNC has
never
been set up right to begin with.

Over the years, I have had a number of occasions where I had to field customer calls on a product. It
was
usually the case that to answer the questions, I quoted the written instructions.

Bud (WB4LTF)

**** Why do some HAMs feel as though they can TELL others what to do.
Someone should have posted a bulletin for a week "inviting" stations to
minimize their activity and digi paths for the MScatt test. Then when the
test comes, just live with what you get... Also, this gives anyone who will
be using APRS for another legitimate purpose over the same time period
ample time to make his requirements known. It is only common courtesy...

> Only a few had the 100 watt or more capability for achieving a signal
> bounce, thus most felt excluded from participating.

**** COMMENT: The GOAL is to RECEIVE DX MScatt packets from a few
high power transmitters. That is how most MScatt systems work.

> Complexities in setting up to participate was more than they could
> handle, and some became quite frustrated without explicit instructions.

**** Again, where were the MScatt Bulletins a week in advance. This is
exactly why I invented the bulletin capability in the first place. It
was not so that each person could put up his own EGO postings...

> I spoke to one individual who could not understand why the test was not
> conducted on an alternate APRS frequency, free of DIGIS.

**** Great idea, find another *nationwide* clear channel for FM packet
     Where APRS stations are all "listening"...

**** So in summary, common sense, courtesy, advance warning, and patience
is all that is needed... Any event that wants air time should be
announced via BULLETIN well in advance. KEEP IT BRIEF! Put the essence
in the bulletin and a refereence to more info on a BBS somewhere. If it
is longer than 4 lines, then you are being VERBOSE... hi hi

>Have any of you seen the new FCC rules regarding RF
>exposure limits as they apply to the amateur radio service?

Hi all;

I downloaded and read the FCC document 96-326, last week.

>The new
>rules
>are quite disturbing...

Only if you don't understand what the document says.

The worst case frequency (for us) is the VHF band, with an MPE of 27.5V/m.

Just off the top of my head, here are a few calculations for radiating your neighbors.

A station running a kilowatt, on CW, will have a maximum duty cycle of 5% to 20%, when averaged over 30 minutes (as the document specifies). Figuring a 20% duty cycle, your output (for MPE purposes) is only 200 watts. This gives an RF voltage of only 100 volts at the antenna. If you assume that this RF voltage is coupled with no losses to the air at one foot distance from the radiating element, then at two feet you would have 50V and at 4 feet you would have 25 volts. With a safe distance of 4 feet, what is the big deal?

Admittedly, this is a gross oversimplification, ignoring such factors as antenna losses, balun losses, transformer effects in matching devices, antenna impedance, antenna/air coupling coefficient..., but still, it should serve to demonstrate that the problem is far less than you fear.

The stations most affected by the new regs will be those running the max legal power, with high gain antennas, such as moonbounce, who will have to put their antennas farther up in the air (no more single tower sections with 19db antennas on them) and apartment dwellers running full legal power with an indoor antenna.

>It looks to me like practically anyone can shut
>you
>down if you are running more than 50 watts pep.

If you think that the FCC is going to waste it's limited manpower and funds on a major enforcement effort... Never mind, I won't comment on that absurdity.

What may happen, if you don't bother to comply, is you might be sued by your neighbor, for radiating her. That is why the FCC document suggests that you retain the record of your evaluation.

By the way, the 1992 standards by IEEE/ANSI are the same as the previously used IEEE/ANSI 1982 standards, so the danger of a lawsuit has been there for a decade already. How many operators have been sued for this in the last ten years?

>The new rules require
>an
>"exposure evaluation" if the transmitter output EIRP exceeds 50
>watts...

Again, read the document... The FCC recognises that, for most stations,

it will be a paperwork drill and suggests that the ARRL, and other
amateur radio organizations, come out with simple-to-use charts to aid
the tech and novice in figuring out where to locate the antenna, for RF
safety. Supposedly, the other license holders know enough about
propagation, to figure it out for themselves.

>what
>a crock!

I agree completely, your letter was a crock of ....

>These rules go into effect Jan. 1, 1997.   Does the ARRL
>know anything
>about this??

Yes, the ARRL has a bulletin out on the new regs... Unfortunately, the
person who wrote did not read the entire FCC document.

The ARRL bulletin states that the new regs and standards are forthcoming.
This is wrong, they are already out. Look at appendixes B and C in the
FCC document.

regards,
Joe

Rendered body type: text/plain

The ARRL knows quite a bit about this, and commented significantly. I will try to find the info if there is an interest, and upload it to TAPR. FCC chose to use the data from another group that suggests increased health risks to hams, and not exempt the Amateur Service from compliance, but noted that most of the hams would not have significant problems complying.

The folks most affected will be those running *REAL* big power and a gain array. Either at HF or VHF and up. Of interest, the 50 watts on a mobile antenna will be legal for most applications, if you are not leaning up against the side of the car, and are not allowing others to do same. If you drilled a hole, and mounted the antenna properly, the auto interior should be "clean."

The broadcast industry have had to contend with these rules for some years, and there is a technical publication about 'em, OST 65. Broadcasters are not happy about the restrictions, but, they, too, point out that compliance by a ham station should not be a real problem.

Big issue: Who's going to do the measurements and certify them? I've a friend in Austin who charges big bucks to the Broadcast industry for the formal study and report. Are we about to be subject to the same?

No, APRS or any packet contacts don't count, but.........

Our club uses this QSO Party for public introduction much the same way as Field Day. We invite people, mostly public services, to look and listen to our radio transmissions. If we have an APRS station on site, this makes it ever the more interesting to the "un-educated". Anyhoo, the APRS station also serves as a monitor of 2 meter conditions, so when KC, St. Louis, Eastern TN, AL, GA or NC show up, it's time to man the radios!

To see all the rules and regs of the September VHF QSO Party, look on page 67 of the Sept. issue of CQ VHF.

73 and Good Luck!

Sorry to say that the big deal is that you have missed some things that are very important. For example, the E-field in the near field of the antenna is increased by a factor that is the Q of the antenna. A typical dipole might have a Q of 10-20. Also you should realize that the voltage at the end of the dipole is MUCH larger than at the center. For 1000 watts running into a dipole with a Q of 10, the voltage at the end of the dipole would be on the order of 10,000 - 20,000 V/m very close to the antenna. That is a lot! What the fcc is interested in doing is preventing possible exposure to fields in excess of the ANSI safety standard (C95.1-1992).

According the Mr. Cleveland (the author of the FCC 96-62 Docket), in all likelihood all that Amateur stations will have to do in the event that they do not fall under the 50w exclusion, is to fill out and post a form showing some simple calculations showing conformance to guidelines. Of course in the event that they do not conform, then some part of the antenna system may have to be changed or power reduced.

>>It looks to me like practically anyone can shut

>
>What may happen, if you don't bother to comply, is you
>might be sued by your neighbor, for radiating her. That
>is why the FCC document suggests that you retain the
>record of your evaluation.
>
>By the way, the 1992 standards by IEEE/ANSI are the same
>as the previously used IEEE/ANSI 1982 standards,

Sorry, blatantly not true! The 1992 ANSI standard created the so called

"uncontrolled" environment which has a lower (by 5x in most cases) level of
exposure. It is to the thanks of the ARRL that the FCC and Cleveland have
decided to allow Amateur stations to be classified as a "controlled"
environment, thus allowing exposure levels that are higher than those for
the general population.

so the
>danger of a lawsuit has been there for a decade already.
>How many operators have been sued for this in the last
>ten years?
>

Also note that the FCC has significantly increased its power of pre-emption
in that it may preempt a local body who claims there may be a health effect.
Thus the FCC will actually protect amateur stations in this way.

I apologize for using this sig for this discussion, but I want to make sure
that proper facts are stated. If you have more questions please email me
direct.

Gosh fellows it used to be great on here when in fact we did discuss
stuff closely related to APRS and it's operation etc etc. Recently i see
everything BUT!. Go ahead and flame but realy folks let's stick with APRS
 and those that use it related messages.

Ok, but it doesn't say *anything* about THAT in the docs. Besides, I
thought you said, in your reply to my original question a week or so ago,
that ARPS kept track of each click *internally* and cleared (or reduced)
the R and P counts after the appropriate time had elapsed. I guess I
didn't understand it properly.

So I guess I have to leave the daily count on the U II until APRS has
reduced the P field to all zeros, correct?

should be no problem using the hp200lx with aprs. i use the paccom y-cable and works with both my paccom handipacket and kpc-3. you need to be sure to have +5vdc on pin 6 of the y-cable to power the small circuit board inside the db-9 connector. the hp palmtop and a lot of laptops don't have any power of this pin, so the y-cable needs to get its power from the tnc. let me know which tnc you're using. whichever one you use, we should be able to get it working.

285. Re: ?NEW FCC RULES...

From: kf4dys@juno.com (Joe Foor)
Date: Wed, 14 Aug 1996 22:40:30 PST
To: aprssig@tapr.org
Message-ID: <19960814.224038.4479.1.kf4dys@juno.com>
Rendered body type: text/plain

On Wed, 14 Aug 1996 19:49:51 -0500 (CDT) Richard Amirault <amirault@laraby.tiac.net> writes:

>What about Mobile Operators?

Paragraph 67 of FCC 96-326 states:
Although our exposure criteria will apply to portable and mobile devices in general, at this time routine evaluation for compliance will not be required of devices such as "push-to-talk" portable radios and "push to talk" mobile radios used in taxicabs, business, police and fire vehicles and used by amateur radio operators.

The paragraph goes on to say that uses other than "push-to-talk" may require evaluation and any station may be required to be evaluated at the FCC's request. Unfortunately, APRS mobile stations are not catagorically excluded.

However, in Paragraph 162 is the statement:
To make the complex determination of possible excessive exposure as simple as possible, we are specifying a threshold limit for transmitter power that will apply regardless of frequency used. Below 50 watts transmitter power, the licensee will not be required to take any action, unless requested by Commission staff pursuant to Section 1.1307(c) or 1.1307(d) of our rules. Above this power threshold, the licensee must perform a routine evaluation to predict if the RF radiation could be in excess of that allowed by the criteria listed in 1.1310.

So, as long as your mobile APRS is less than 50 watts output, it is also excluded from the "routine evaluation" requirement.

I expect, if someone does a "routine evaluation" of an APRS station, they will find that the low duty cycle will cause it to have even less averaged output than the "push-to-talk" stations.

regards,

Joe

I hope he didn't make the same mistake as I did when I first got into
packet, I went to Radio Shack and told them I wanted a "Serial Cable".  They
gave me one.  It didn't work.  I took it back and said I wanted a "Modem
Cable".  That one worked fine.  The cable has GOT to have pins 1-8 and 20
(or something like that).

If he gets it to work with a communications/terminal program he's halfway
there.  If he can't get it to work, then don't try to get APRS to do
anything til it works as a tnc 1st.

299. Help with KAMPlus rf feedback

From: bob <w2g3zfj@unix.asb.com>
Date: Fri, 16 Aug 1996 08:22:43 -0400
To: aprssig@tapr.org
Message-ID: <199608161222.IAA21311@unix.asb.com>

Rendered body type: text/plain

Hi There

Thanks for reading this.

I have been running as a GATE on Long Island for the last few months. However, I have had a continuing problem which I have not (as yet) resolved, causing the GATE to be HF to VHF only. The problem is that when APRS causes the TNC to transmit simultaneusly on both HF and VHF my HF transmission causes interference on my VHF transmission. This results in no one seeing me on VHF if I operate as a full gate. I have tried all manner of filters, separate power supplies, grounding etc etc to no avail. Also this happens with anything above 2-3watts output on the hf rig. Anyone got any ideas? In the past I have had problems with rf feedback onto my HF transmissions but never onto the vhf signal!

Station details are:

TS450S
HF6V antenna (swr 1.1:1)
KAM Plus
TM241A
Astron psu

Any help appreciated!

Thanks

bob w2/g3zfj
w2g3zfj@unix.asb.com

Rendered body type: text/plain

MAN did I have the same problem...I couldnt figure out why I wasnt getting into the VHF digi (1 mile away).

My VHF signal sounded like HF cause they both keyed at the same time.

I did 2 fixes...

```
#1 reposition your vhf antenna if possible, slightly further away or at a
different angle from the HF antenna. This helped me, but I use a MFJ loop for
HF and they are a bit directional.  I finally RAISED the HF antenna above the
VHF push up pole and it worked. On humid nights though they sometimes still
QRM each other.

#2 When APRS is off...I set the beacon to different intervals like
BE 10 / every 14   this makes HF go every 10 and VHF every 14.

WOuld be neat if the software would key them up seperately though

I tried filters, chokes ad nauseum...They only made a slight difference.
Good luck

Furthermore, if you are a member of ARRL, and have
a subscription to QST, always make it a habit to
check out the "Packet Perspectives" ariticle in
there, as the last couple years, Stan Horzepa/WA1LOU
made the operating instructions available to EVERYONE,
as EVERYONE is not on the Internet yet.  These
instructions are printed in QST well in advance.

If you are able to, put the message that explained the
instructions to the Mscatter test somewhere on your
HD for future reference, as I think the instructions are
valid for future Mscatter tests.

Need I say more? ....

//////////////////////

So ur qrn ing ur self?

I had same thing. This may help.

1.      ground everything: rigs, tnc, computer, etc.
2.      make sure all power supplys are on the same AC line.
3.      position hf and vhf ants as far away as possible
        also if using a dipole, check where the ends are located.
```

```
4.      if possible set ur tnc so that both ports don't tx at same time?

I have aea and so far found no way to do that yet?
Anyone know if the pk-900 aea can be programed to delay one or the
other so they don't both tx at the same time?

APRS-type people,

Is the HSP being talked about here for use with an HP200LX any
different from the HSP circuit contained within the GPS.TXT file
that's part of the APRS docs?

I've built several of those for use with "normal laptops".  Is there
any reason why they wouldn't work with an HP200LX?

Subject:        APRS

Arte,
     I've tried what you've said, even with the latest version
of APRS (76f, I think).  At any rate, even after changing the
PARITY command for the KPC3, I get some sort of error.  First
APRS tells me that the TNC is not responding.  Then it gives me
some sort of "I/O Glitch" error.  And I've found that after ex-
iting the program, my high memory areas are corrupted!  I know
that all of the hardware is connected properly, and I've even
tried disabling the high memory and running it, all with the
same outcome.  Do you have any suggestions?  Thanks in advance.

Rendered body type: text/plain

I have been using JUNO for some time now and it is really trick! Besides
being extremely user friendly and easy to use, it is quick and more
efficient than this Procomm I use for the APRSSIG messages. I have had
no Junk E-Mail or Junk Snail Mail because of it and have not seen any of
the advertisements Juno is supposed to have. I heartily recommend it to all
who can't afford the ISP or AOL stuff. W The only drawback is no attached
files or FTP or Web surfing, but since it's absolutely free, U know what they
say about GIFT HORSES! I still use the CATI.S

oops thats CATI.CSUFresno.EDU adr just for this SIG so I have it seperate
from my personal E-Mail. 73, Pat WA6MHZ   wa6mhz@juno.com

313. Re: [APRSSIG:3782] Help with KAMPlus rf feedback

From: John W Wilson <z004391b@bcfreenet.seflin.lib.fl.us>
Date: Fri, 16 Aug 1996 20:44:27 -0400 (EDT)
To: aprssig@tapr.org
Cc: aprssig@tapr.org
Message-ID: <Pine.3.89.9608162032.B23971-0100000@bcfreenet.seflin.lib.fl.us>
Rendered body type: text/plain

I have had the same troubles. The first thing I did was to replace my
TNC to RADIO cable with one that was properly shielded. It was a start
in solving the problem. The next thing I did was to put some ferrite
chokes (beads, clamshels, etc) on every wire going to/from the TNC. That
did it.

The problem, of course, is RF getting in and modulating some of the
digital and analog signals in the TNC, and the only way you can fix it is
to put some metal shielding on the wires and also to choke the RF on the
outside of the wires with the ferrite.

We have a TNC at a TheNet site where someone connected the audio from the
speaker out plug to the TNC with a single unshielded wire. He had done
that in
the past and it had never caused problems, but at that site there was a
lot of RF nearby and it did cause problems. As a short term solution I
wrapped the audio wire around a Radio Shack ferrite choke and it did the
trick. I went back (months) later and re-wired it properly using RG174.

73,

John W. Wilson, KN4HX

You can attach files and send them thru JUNO...under file in the upper left corner is
the command...insert text file into message... the file must be ascii and
have a txt extension.
We send files all the time...even net rosters and other things.  It works
very well.  the
only thing you must make sure there is no binary text in the file...if
there is you will get
a pop-up message telling you that there is binary material in the file.

This is a common problem with the KAM+ and Kenwood model radios on HF. If
you are using the rear accessory jack for the data you must apply ferrite
beads to the white lead (audio). Kenwood refuses to acknowledge this problem
and Kantronics says it is not theirs. I have not dealt with it in years
since my KAM + is only a backup but many many people with Kenwoods have
complained in the past so there is plenty out on it.

BTW I have also noticed MAJOR RFI on Audio when the Data Plug is connected
but someone is using a mic. The only way it will clear up is if the plug is
disconnected from the back. Beads have helped for this but not too much,
this is another common problem but one I do not care about since I have had
APRS running non-stop on the rig for over 3 years now. Don't even know
where a mic is in this house!

My Rig is a TS-850 but I have heard and read about others with TS-450's
dealing with the problem.

Probably only with respect to the pin(s) providing the power source.  If
someone's already nuked it out, I'd rather build it once...

One probably could UUENCODE a binary file and send it though.  The whole
purpose of UUENCODING is to allow transfer of binary files to be
transfered as text.  The down side is a UUENCODED file is typically 30 to
40 percent larger than the original file.

Juno should allow folks who otherwise have no access to Emai to have
affordable (free) email with which to participate on the SIG.

I gave it a try and ended up deciding to set up a forwarding account to use
while on the road.  I will forward my mindspring account email there so I
can use Juno's 800 number.  My provider does not yet have local access in a
lot of cities, but Juno does!

I would surmise that binary files could be sent if uuEncoded into an ascii
message. Don't know the maximum length, though.

Just like the GPS discussion of a year ago (when folks were peeved about GPS
messages being in the APRS SIG, I feel that this form of Email will bring us
lots more APRS users... or are we some kind of "private, exclusive club"
that doesn't want participation from outside?  ** I Don't Think So!**

I have an HP200LX and a MeridianXL. The Meridian sends out a NMEA
signal which the 200LX will read via the communications software
in the ROM but when I try to use other programs to get the data from COM1
and send it via cell phone through a Megahertz PCMCIA card as COM2
I get nowhere. What do I need in order to utilize this setup?

Thanks in advance for your help

 Try writing a qbasic programs that reads com1 NMEA into  a string file and
then read that string out to com2.
With this approach you could parse out the NMEA string you want or even make
it a menu choice.

Hi Mike,
   Up on 18110 at 1600gmt while ago, sent u msg, no response, very
quiet out here in CA. will try come up every even GMT hr today for
test, copy 30M fine as usual, so far @1635GMT have foll on 30m, from
your area, N8CGY/WX, KE2VW-3, W5RPQ, KB0MQQ, VA3MER-5, old regular
friend, mike/N6OOA-2, in his van.. hi..
  Ocassionally hear HH2B, think it is, CW ID'er and good indication of
propagation on 30m. Was thinking perhaps pass to sig, idea of WA area
station, S-Calif or me station, Florida, New england and old standby in
KC area puttin out 30-45 min CW ID sigs, for propgation purposes.
  I mostly rcve KC , lakes area stations, new england and florida, and
texas area frequently here on 30M/10151, and cw id's would let others
know how prop is going.
   Would a few cw id's be too annoying on our hf freqs, whats the sig's
opinion. ????? (Only the few 4 corners and central US would xmit short
cw id for propagation useage only.) ?????????

The BIGGEST reason I like the KPC-3 in WA9CJN WIDE/RELAY is that with the
remote capability, I can sit in my QTH and change Unproto paths, check the
MHeard list, and do gobs of other stuff to it, even tho it's 17 miles away.

And as we only use it for APRS, 1200 baud isn't a problem.

I am using version 6.0 <Obviously> for APRS as a tracker. And I have some problems with the TNC locking up and spewing data as if some one had connect to it. The CMSG is set to DISC. and the internal battery has been taken out. I thought that it have been because of some wiring problems, however those have been checked, and I havent found any problems.

If any one has any suggestions, other than buy a PICO, please let me know.

Hi again Mike, 2000GMT WEST COAST HF 18110 TEST.
  Was also on 17m, at 1810GMT for 15min or more, nil heard, quiet as could
be on 17M, no sigs heard tuning the band.
  As of 2000GMT, followin HF APRS stations copied on 30M/10151
N9VHW, his new antenna always gets him into my QTH. VA3MER-5 on his Yachet,
KE2VW-3, WX reporting, N0AN, Mobiler Mike/N6OAA-2 WX reporting, N8CGY,
KU0G-1, a daily regular out here on the beautiful blue Pacific , when its
not foggy like today, KB0MQQ in Colorado, KJ7HZ-1, in Utah, W7FEN-4, up
in WAshington state, gettin to be a regular on HF.
   And of course the double nickles from TEXAS are alwasy QRMin my screen
W5RPQ, AND AB5TB on today.
   Our usual Southern Calif. Short Skippers in daily, mostly GPS mobiles
but a new dedicated APRS digi, NW6H-10, KO6XS, and from the very South
of Calif, San Diego area always short-skipin on HF, today we have
KI6MP-10, the southern most Digipeater on APRS, in Ca that is, don't get
jealous FL. KB6TPQ, KA6PSG-14, KD6UDC, usually GPS mobile, KJ6NJ-9 always
mobile and last but not least KE6GXP-9.
   This the usual moring HF on the mappers, after 22-2300 more Eastern stations
show up on 30M/10151 HF, frequently heard till 9PM or 0400GMT here on West
coast, 2 blocks from the Pacific. I'll give u another report later today,
and my monitor of 18110 nothin nil caput, quiet ere at my QTH, RITE NOW
2025GMT .

While I don't have any direct experience with PacComm, I know people that are quite happy with their products.

My problem with the Kantronics KPC-3 is that it has NO provision whatsoever for running 9600 baud, and the only place this is (has been, anyway) documented is in the users manual. Since the "modem disconnect" is a standard feature of TNCs (present in some form in virtually all TNCs), the lack of this header is an exception to the rule.

(As an example, say that you bought a new car. A week later, you had a flat, only to find that a spare tire was not part of the car. How would you feel then?)

(This is my final posting on this topic.)

I've downloaded the 100K DLG files from the usgs ftp site for my area,
uncompressed them, and attempted to run MK100K2A, no matter what
'center' Lat/Long and radius I enter the program informs me that there
are no points found.   Then gives me the 4 corners of the map files (my
center lat/long was right in the middle).

I've tried every combination of + and - Lat/Long for the 'center', but
the program always converts them to:

+Lat N, and -Long W.

Can anyone help?

OK since I did not want to shuffle my serial ports around I setup an old 386
with a monochrome VGA monitor. When APRS starts I just get a bunch of dots
on the screen faintly resembling what is supposed to be there. Will APRS
work with a monochrome monitor or does it require color? The video card is a
Paradise PVGA1A circa 1988. Do I need a special driver and if so where can I
find one?

Thanks for all the help.

Rendered body type: text/plain

2200GMT 17TH, 18110mhz APRS HF TEST.. from Calif.
Zeroed my 5 pages of position logs at 2145gmt, First 30M station copied was Rich/N2CZF in Fl, KU0G-1 in KC, KB0MMQ in CO, KA6PSG-14, in southern CA.

Heard and copied on bottom of screen, but not plotted or gated on map from HF to VHF side, were KK4BZ, K2MEB, N4WYK, W2IE, these could also have been digied/repeated/or uplinked from another local area 6 station, just observed their calls/short posits xmsn on bottom of map screen. ????

2205GMT QSY'd to 18110, freq very quiet nil being heard tuning back/forth. xmiting my posit and msg to KD4EMI..

QUOTE: To KD4MEI : GA MIKE, 2205GMT NO COPY ON 17M IN CALIF. VERY
QUIET BAND .. UNQUOTE

Tuning the 17m band at 2218Z copied following on 18107.15 (Knwd TS440, Inv V 25ft, cut for 30M0. ""MENBBS/K4JJV/H FAX (506)22-27-64 "" several other packet bursts heard but above all copied on bottom line of APRS map.
Call to a William Thompson Born 18, Mobile, Alabama. No other sigs heard entire band.

AT 2240Z returned to 30M/10151. As usual, hear lots HF packets on the Kam Plus, but they don't print out on bottom line or get gated, or appear on the USA map.

I run a 386/33 computer bout foot away from the TS440, on the suggestion on aprssig other day about trying 14100, I get hetrodynes from 14093 to about 14105, and have previously tried the 14096 belive it was suggested year or so ago, but just did'nt work out. Also regardless of the HF.TXT readme file think we should not possible QRM the 14100 Internationl beacon frequency.

I previous also suggested trying 14090, or we could try from 14110 to 14115, the Kam Ops book suggest PACKET from 14095 to 14115. Give me a date and time I'll try anything once.

At 2250GMT back on 10151, my afternoon short skip back, copy W7FEN-4, in Seattle area, KB6TPQ, KD6UDC, KA6PSG-14, SDiego area, S-4/5 BUT Not comin thru the gate to VHF side, normal for HF sigs.

Copy strong N9VHW @2255GMT, KI6MP from SDiego. Following BEACON stations heard and on the L-log, W9JIU, N2CZF, KI6MP, W5RPQ, KB0MQQ, KD6UDC, KB6TPQ, N4WYK, W2IE, W7FEN-4, N9VHW, KO6XS KF0ZH, all apear on Beacon Log, 3 pages. but not on P-Position log or on the map.

2305Z, usual S-5 W7LUS copied ere and on the map, but didn't go thru the gate to vhf side. Even with good strong signal. He appears out here in the mornings with good strong signal, and have copied his LUS-14 often fm NMex, TX and southern states.

2311Z, VE3NP plotting on map, gateway to Muskoka, Ont. 30m<> 144,39.
2325Z, N9NLE, copied near Chicago, 2326, copied KA8CNI, BEACON xmisn.
2333Z, rcvd BCN from N0AN, and lastly 2348Z, Willie/W3YTS fm WashDC.
2359GMT or 5PM PDST 17M & 30M from here in California.

Never mind. I think I found the problem. Seems the DLG 'boundry' files I first tried this on had no data points in it.

When I included the hydo, hypso & trans data it seems to work OK.

  Yes, it will work with monochrome, either version DOS, or windows. There
may be some confusion of certain details at time though as some choices of
colors don't always translate to B&W the best to make it easy to interpret.
I had a B&W laptop I use quite a bit. No special drivers will be needed.

348. Useless Bandwidth doesn't have to be a problem

From: w4wwq@juno.com (Peter J Lascell)
Date: Sat, 17 Aug 1996 21:57:04 PST
To: aprssig@tapr.org
Message-ID: <19960817.215852.5399.3.W4WWQ@juno.com>
Rendered body type: text/plain

```
Comments about JUNO raised a howl of at least 3 known users of this SIG.
Probably many more felt the same way but held their tongue.  In the past
the argument was the storage space the useless bandwidth took and the
expense to the SIG user for that space or each message.

I have gripes  too about what is useless here but my view is apparently
not the same as the rest.  I care less about the HF gate discussions and
weather station stuff and more about the .79 network out to about 300
mile radius and local APRS events.  My choice.

A real control we all have to sort out our preferences is by using the
SUBJECT line of the message to reflect the real subject, not just
RE:something that by now has been replied to so many times the real
subject has been lost and is totally unrelated.

If we control the SUBJECT line of the message, then those with specific
likes and dislikes can breeze through the messages with a fast finger on
the DEL key.

If the message count is still a real problem causing a $$$ issue, I hate
to say this, but JUNO is FREE. ( I had 201 messages stored up waiting
for me after a weeks vacation.  No fee.)

Remember to view the tools we use to enjoy our hobby as necessities to
make life  easy.  Some are hardware and some are software.  Some might
be a service, like a QSL bureau, or e-mail server.

BTW, over two months ago I sent a message to this SIG about JUNO.  But I
don't think  JUNO was in the subject line.   I probably pointed out how
others could get free access to the SIG to participate with us here.
Not one (1) response was posted pro or con to that message.  What a
difference a day makes, so to speak.

I am changing my WEB SURFING account looking for the cheapest, so any
flaming will have to be addressed to my free account:  W4WWQ@JUNO.COM.

Well Lew i don't think it's anything your doing wrong. The file format of
the USGS data files where changed a while back and are not (As far as i
know) compatible with any of the software we now have available to us. I
have attempted to do this also for other areas then what my CD covers and
have had no luck at all. I did see a message posted a while back that
someone is writing a new program that will work with the new format.

Several of us are now on 20 meters on a hopefully more quiet freq.

Look for CW beacons (mine is every 5 min)
and APRS Digital on 14.090 LSB.

Hope to hear some action...

Though we've been hopping around it has been kinda fun, learning about the
different bands that Ive not operated in a while.

So again, tune up your rig and listen for our beacons and see if you can copy
it.
Mike KD4EMI@AOL.COM

353. HP200LX and HSP

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 18 Aug 96 02:25:13 EDT
To: <aprssig@tapr.org>
Message-ID: <960818062513_71301.3106_FHJ71-4@CompuServe.COM>
Rendered body type: text/plain

My apologies to the folks looking for advice on the mods I mentioned last week about hooking up the HP200LX using the Hardware Single Port. Debugging of a certain mapmaking program (soon to be official) has kept my ham/APRS time pretty tied-up.

But about the 200LX/HSP mods...

First, get \APRS\README\GPS.TXT in front of you, and scroll down to the HSP schematic. I built an HSP following this guideline and it did not work. After reading the accompanying text, it became clear that this circuit needed some "empirical engineering". Three changes were necessary before it would work with my combination of 200LX/KPC-3/GPS-45:

1) +V (upper right of schematic) needs to be derived from the TNC's DSR line (pin 20, I think). "Stock" HSP's take their supply from the computer's RTS, and that's a bit of a drain on the HP. The KPC-3 has to be modded to do this, and the mod is in the back of the manual.

```
2) The two bias circuits (labelled "note 1" and "note 2") have to be omitted.
This also simplifies the wiring immensely.

3) The two voltage drop diodes under "* see important notes below", on the
emitter of the top transistor in the schematic also had to be jumpered around.
This was for the Garmin GPS-45 and may or may not apply to your situation.

That's what I had to do to make mine work; of course, your mileage may vary!

FYI:

(do we see anybody we know?...)

THE NATURAL LIFE CYCLE OF MAILING LISTS

Every list seems to go through the same cycle:

1. Initial enthusiasm (people introduce themselves, and gush alot about how wonderful it is to find kindred souls).

2. Evangelism (people moan about how few folks are posting to the list, and brainstorm recruitment strategies).

3. Growth (more and more people join, more and more lengthy threads develop, occasional off-topic threads pop up).

4. Community (lots of threads, some more relevant than others; lots of information and advice is exchanged; experts help other experts as well as less experienced colleagues; friendships develop; people tease each other; newcomers are welcomed with generosity and patience; everyone -- newbie and expert alike -- feels comfortable asking questions, suggesting answers, and sharing opinions).

5. Discomfort with diversity (the number of messages increases dramatically; not every thread is fascinating to every reader; people start complaining about the signal-to-noise ratio; person 1 threatens to quit if *other* people don't limit discussion to person 1's pet topic; person 2 agrees with person 1; person 3 tells 1 & 2 to lighten up; more bandwidth is wasted complaining about off-topic threads than is used for the threads themselves; everyone gets annoyed).

6a. Smug complacency and stagnation (the purists flame everyone who asks an 'old' question or responds with humor to a serious post; newbies are rebuffed; traffic drops to a doze-producing level of a few minor issues; all interesting discussions happen by private email and are limited to a few participants; the purists spend lots of time self-righteously congratulating each other on keeping off-topic threads off the list).

OR

6b. Maturity (a few people quit in a huff; the rest of the participants stay near stage 4, with stage 5 popping up briefly every few weeks; many people wear out their second or third 'delete' key, but the list lives contentedly ever after).

Make sure the KPC-3 is not in NEWUSER mode
by entering the command "IN TERMINAL"

Then, make sure the KPC-3 is not putting a new line
between the packet header and the data with the
command "HEADERLN OFF".

   Where were you when he passed out the brains? This list is for topics
relating to APRS and GPS to a lesser extent. Please try to keep this in
mind. Those who are unable to follow these simple rules will find
themselves flamed. Most of us would prefer that this list does not have
to become moderated because of the few bad actors.

Results of the 1996 APRS Perseids Meteor Scatter Test

The following stations reported:

6 meters: N8WAV

2 meters: AA8SF, KE6AFE, KF4DYS, KO4HD, N8WAV, WA1LOU, WB4LTF, WD0GNK, WJ9H.

Only two reports of any success were received. They were both on 2 meters, as follows:

1. KF4DYS in FL received WB4LTF in FL/EL98ip over a 300-mile path at 1201Z on August 11. WB4LTF was using 160 watts into a 5-element Yagi.

2. KO4HD in FL/EL94 received AB5TB in TX/EL29li over a 950-mile path at 1919Z on August 11. No equipment report was received.

Comments: I am not too lucid today as I have not gotten much sleep since driving back from MV Friday PM and Saturday AM. As a result, I am not going to expound on these results too much only to say that compared to last year's test, we received about half the number of reports and only about 10 percent the number of reported successes. My guess is that this was due to less participation caused by (1) less publicity of the test, and/or (2) more normal APRS activity on frequency interfering with the test and/or discouraging stations from participating in the test. Still, the successes do indicate that packet radio meteor scatter communications is possible and further experimentation is warranted.

73,

Stan "going back to bed" Horzepa, WA1LOU

Bill, Lansing and others who are interested,

Both the old format (the USGS calls it the OPTIONAL format), and the new
STDS format are on the usgs ftp site.

ftp://edcftp.cr.usgs.gov/pub/data/DLG/100K/

In each subdirectory for a particular quadrangle you'll find the
'boundary', 'hydro', & other data in individual files with a file name
like xxxx.opt.gz - these are old formatted DLG files. You'll also
find one file named xxxx.std.gz - that's all of the data in one STDS
formatted file.

Download the xxx.opt.gz files, then uncompress them with the GZIP
utility (download GZIP-1.2.4.MSDOS.EXE & run it. It'll uncompress into
GZIP, etc. Then use the -d parameter to UNcompress the USGS files.)

ftp://prep.ai.mit.edu/pub/gnu/

MK100K2A will be able to read them. You won't need
the CHOP.EXE utility since the new MK100K2A can read these un-delimited

files directly.

Hope this helps.

Lew Midlam - W7LVW

Hi Alan,
   per sig msgs was trying qso on 17M yesterday and 20M 14090/LSB today
but earlier a contest RTTY/PACket qrm everywere, finnally for couple hrs

1600-2000 on 14090/LSB but RTTY qrm and some new kind of mode, short
LOW PITCH TONE BURSTS, unable copy any mode. So at 2000 up to 14115LSB
but no luck their either. So back to old 30M/10151/LSB, standby, always
noise or some kinda action, there. East coast starts comin in bout 3-4PM
ere 22-2300Z we possible qso on short skip had u known sooner. Maybee next
week or on 15M, gotta find some action somewhere. Msg fm Geo/W8FWF, HE LET
some lightning get into is rig, so off air and in shop for repairs. Poor
Geo, we don't get lightnin ere, except very few in winter storms. Oh yes,
WX program no worki, with Peet 2000. Hi..
   73's & Enjoy, tks for call.

Lessons learned today on 20 M hopping...

#1 RTTY is fun !!   Never used the mode but made lots of contacts (45)
in no time flat. Suddenly the whole thing got quiet...(contest finished at
noon est)   VIA EMAIL on internet was able to coodinate band hopping.

#2 CW really works too....
No copy of packets but sure could copy the CW id's from the stations !!
Was getting a sandwich, heard nothing then BOOM CW id came right through the
noise...

#3 Whew..20 meters is a really congested band.
#4 See #3

#5 Whilst tuning heard mucho DX packet stations and nodes on 20..
(never did figure out who the "LONDON" node was though, anyone know?)   Left
a few msgs on mailboxes extolling APRS and trying to see if they are
interested.

Last
#6 Loop antennas are fun, and DO work, but not like a REAL antenna can.
At best it's a super neat comprimise...Love/hate relationship..Love that
Narrow bandwith--hate that narrow bandwith..

Back on 30M for now with CWID off...
Mike KD4EMI

374. mk100kv3

From: "Carolyn Cavanagh" <cjcavanagh@msn.com>
Date: Mon, 19 Aug 96 00:00:05 UT
To: aprssig@tapr.org
Message-ID: <UPMAIL02.199608182356400334@msn.com>
Rendered body type: text/plain

```
I have posted the new version of mk100k to the .../aprssig/files/upload

This is a user feedback version with a couple of critcal bug fixes.  The
following is from the text file in the .zip file:

MK100K3.EXE

Version 3.0 of code to make APRS maps from the 100k DLG CD
Beta release 06 Jun 96
Final release 29 Jun 96

Jack Cavanagh, KB4XF

This is the user feedback version.  The requested changes or additions were
made principally by Bob, WA4APR; Bill, KE4EER and Ken, W7KKE. I did not agree
with every change, but went ahead and did them anyway rather than engage in a
long distance debate.  Thanks for the suggestions, guys.

- I think I finally got the file name problem licked. It turned out to be two
problems.  One was related to the different ways DOS and BASIC handle the
"null" character. The other was related to not filling out a field in a random
access file record.  This screwed up file pointers if you did not use a six
character name.  If you use less than six character names on multiple map
files, it will now work!

- The code no longer makes *.map and *.dat files.  I took out my crude
decimation scheme.  The program makes *.dat files. If the file contains 2999
points or less it will be renamed as *.map. Otherwise, operate on the *.dat
```

files with MAPFIX to get them down to size. Rename them *.map and then load into mapfix. Maybe Bob will modify mapfix to accept *.dat files without having to type the extension explicitly.

- Now you can make any number of maps in one session within reason. You can make an N by M grid of maps. N and M must be 26 or less and the product of M and N must be less than 676. I had to set a limit based on the ASCII codes for letters. NOTE: If you use this option, the starting point is the lat/long of the upper left corner and not the center. You will still get the 5 percent overlap so your input numbers will not show up in the map files.

- No one responded to my plea for suggestion on how to label big sets of maps. So you are now stuck with my simple scheme. The maps are labeled by row and column using the letters of the alphabet. Thus a map with the file name xytuvzdf.map is from the 4th row (d) and the 6th (f) column. This is the reason for limiting to 26 in any one direction. More than 26 and you would end up with a filename containing invalid DOS file name characters.

- The intermediate data are now stored in a file "tmap.raw" before the short segments are chained together. Some folks thought just "temp" might be a problem.

- Ram drive: This was Bob's request to save his hard drive. If you set up a ram drive, you can use it for tmap.raw. This file gets exercised a lot while chaining together the short little segments from the CD into something reasonable. The input file and the output file are read once and written once respectively. Thus a ram drive here is of no real benefit. To use the ram drive, start the program with the command:

```
mk100k3 d:\
```

where "d" is the drive letter of your ram drive created with ramdrive.sys in your config.sys. NOTE: This will probably cause the drive letter for your CD or zip or jaz drive to change. Be forewarned!

To set up a ram drive from DOS add the following to your config.sys file:

```
devicehigh=c:\dos\ramdrive.sys 128 /E
```

This will set a 128K ram drive in extended memory. This is big enough for tmap.raw. Consult the DOS on-line help files if you want to use expanded memory or want a bigger ram drive. If you use Win95 use the following instead in config.sys:

```
devicehigh=c:\windows\ramdrive.sys 128 /E
```

- The user dialog concerning CD vs. FTP files and blocked vs. unblocked has been shortened in favor of the CD user. If you use the CD just hit ENTER.

- I have made doubly sure that the last line in the output file contains "0, -1"

- The user now can get small road detail down to tracks and jeep trails. If you follow your maps radius value with an exclamation mark (!) you will get any and all data on the CD files including railroads, pipelines, etc. (if you extracted the data from the CD). You will also get every little stream and water filled ditch. Try this in an urban area and you will be running MAPFIX all night.

- The program does not stop any more if there was no data to be found. It continues on until all possible maps for the current grid have been made or not made. A log files is written telling you the size of successful map builds in APRS map points and shows maps for which no data could be found in the files extracted from the CD to your hard disk. The log file has the name "filename.txt". "Filename" is what you typed in at the beginning of the mapping session.

- The number of pixels per degree has been doubled. Bob wanted this for zooming purposes. So I did it. However, points are points and we can't get any more resolution than is on the CD.

- Oops! key. Hitting F10 will stop the program while making maps. This saves having to reboot if you realize that you made an input error.

Win95 and all that.
This code was written in Microsoft QBasic 4.5 and the compiled .exe files will run under DOS, Windows 3.1 and Win 95. Win 95 opens mk100k3.exe with a small window, but this can be permanently fixed to a full size screen with the "properties" selection accessible with the right mouse button (or the left

mouse button if you set things up for a left handed mouse). You're on your own.

What's not finished

Some maps have missing line segments near the edges. Actually all maps have them, but they are only noticed when you get down to the 1 or 2 mile level. These are short straight lines that begin off the map and end on the map or vice versa. I have looked at the code and was able to handle the end of the line that goes off a map. I looked at the case of a line that begins off a map and concluded that a major re-write of one section will be necessary. I may get to this in a month or two but I am not in the mood at this time. Mapfix can add a short extension to the line if this is bothersome.

What's next ?

This depends of the users. If I receive requests that are easy to code along with appropriate compliments and stroking of my ego, I might be persuaded to code a version 4.0. Any monumental goofs will be corrected in a version 3.1 if required. Otherwise, I think it is time to move to something else. Let me know.

Hard copy of maps. PLOTMAP.EXE

Along the way, I have written a program that produces hard copy of APRS maps. You need to have a laser printer or ink jet printer that supports HPGL. The HP3 and HP4 series support the HPGL vector graphics. A preliminary version is available on request. A final version will be uploaded to tapr/sig/..... in a few weeks. The present version is limited in the number of maps that it can handle in its DOS based file selection menu. I have commissioned my son, Kevin, a recent computer science grad, to code a C++ routine that imitates a Windows file selection window with mouse support and is unlimited in number of files. If we can figure out how to link the QBasic and C++ object files we may have something. Drawing the maps was a breeze as APRS maps are vector graphic maps to begin with. In a regressive step, HP has eliminated the high level commands that used to draw and label axes in HPGL. Most of my time was spent coding little tic marks and labeling a couple of tic marks for reference. NO!, I will not make any changes or add more tic mark labels. The source code is available for any masochist who wants an improved hard copy.

> PLEASE STAY OFF 14.100! THIS IS THE PROPAGATION BEACON FREQUENCY!

APRSdos REPLY/COMMENT: Absolutely correct. But please lets all be specific. 14.100 CW ZEROBEAT is the CW beacon frequency. Tuning your packet radio to 14.100 LSB is no where near the CW beacon frequency. The packet tones will be either 1700 or 2100 HZ lower and not impact the international CW beacon frequency at all... and since packet is usually referred to by its LSB equivalent this is the convention. To avoid the CW beacon frequency, packet operators should avoid 14.101 to 14.102...

APRSdos REPLY/COMMENT: A way to avoid both the HF and VHF transmitting at the same time, is to use O-C-T mode to set the TNC VHF beacon to every 10 minutes and the HF beacon to 0. Then operate APRS on HF only (or the toerh way around). This way, the VHF beacon of your posit is independent of APRS and will NOT occur at the same time a the HF (which is garbling your packet on VHF)...
